## **PREFATORY NOTE.**

The present little book, which is issued only in English, is an extract of a work on German Education, that has been edited by me, in conjunction with a large number of collaborators, for the International Exhibition in St. Louis, at the suggestion and with the support of the Prussian Minister of Education.\*) The work is dedicated to His Majesty the Emperor, and treats, in four volumes divided into six sections, of the Universities, the Secondary Schools, Elementary Education, the Technical High Schools, the High Schools for Special Subjects, and the Intermediate and Lower Technical Institutions. For further information on the subject the original work may be consulted.

Some parts are a close translation of the corresponding chapters of Dr. v. Gizycki (*A General View of the Elementary Schools*) and of those of Professor von Dyck (*Technical High Schools*).

Göttingen, March 1904.

## I. UNIVERSITIES.

---

### 1. A Short View of the Historical Development of the German Universities with special Reference to their Connection with Scientific Knowledge.

The following pages are intended to give a brief outline of the development of the German Universities, chiefly with reference to scientific knowledge and methods of instruction, to impart which forms indeed their essential function.

Division of the History of the German Universities. — The division of the History of the Universities, as based on their connection with science and scientific research, presents, naturally, two large sections. The first and larger of these embraces the time of their rise in the 12th century to the beginning of the 17th century; the second comprises the 18th and 19th centuries. During the first period the Universities were, in the first place, schools that were made subservient to the handing down and acquirement of a fixed fund of scientific knowledge. In those schools the ancient philosophy and science, since the 16th century the whole literature and mental culture of classical antiquity, were admitted and digested. In the second period, the Universities, especially those in Germany, have become the chief bearers of the fully and independently developed modern philosophy and science.

Each of those two larger periods falls again into two subdivisions, so that we obtain the following fourfold partition.

First Period. The Middle Ages. — Growing up on the soil of the universal Church and its spiritual life, the Universities, in this period, reduce the western world to the formative discipline of Greek philosophy and science, especially of the Aristotelian system.

Further, they promote the thorough scientific organisation of the church-doctrine and of the ecclesiastical law, and bring about a knowledge of Roman law and ancient medicine.

Second Period. The 16th and 17th Centuries. — This is the period of transition between the Middle Ages and modern times: the 16th century, the time of the Renaissance and Reformation, the 17th century, that of the rise of the modern state and society, and at the same time of modern philosophy and natural science.

In the movements of the 16th century the Universities take a considerable part, not equally so in those of the 17th century: the new philosophy and natural science were not born within their walls. The result was that they remained behind the time and fell into discredit.

Third Period. The 18th Century. — This is the period of the reception of modern philosophy and science by the German University, at the same time the period of transition from the old principle of the obligatory standard of instruction to the principle of liberty of thought and teaching. The incentive to independent thinking and the fructification with philosophical ideas appeared prominently in the teaching as the highest task. The German University, in this period, had obtained the lead, not only in the mental life of the nation, but at the same time in the development of University affairs of the whole European world.

Fourth Period. The 19th Century. — This is the period of the advance of the single branches of learning, and of the organisation of scientific research. The research in the field of natural science and of history is emancipated from all philosophical or theological dogmatism, so as to gather and work up facts by individual labour. In this the German University maintains the lead, it attracts investigators, disciplines the various forces, and organises labour. In its teaching this change appears prominently in the development of the seminary system; to induce the student to take an independent part in the scientific work, is considered to be the chief task of the teacher.

## 2. A short View of the Present Organisation of the German Universities.

1. The German Universities are exclusively state institutions. It is true, there would be no obstacles in the way of establishing, on the part of municipalities or of private founders, colleges after the model of Universities, but such institutions would not have the prerogatives bestowed on the Universities by law of the States or of the Empire, unless they acquired them by special concession. The granting of academical degrees by no means forms the most important of these rights; it is of far greater significance that for appointments in the Church\*), for employment in judicial and the higher administrative and educational functions, for admission as barrister, for the practice of medicine (on the basis of imperial legislation), a course of study at a German University is prescribed as a necessary condition.

The Universities possess the personal legal rights of public law; as is expressly stated in the Prussian common-law, they have the rights of privileged corporations. Their inner administration has been regulated, for each University and its faculties, by sovereign privileges and statutes, dating from very various times, and by supplementary ministerial decrees.

All the Universities possess considerable assets, in the shape of buildings, collections, etc., besides endowments for the purpose of bursaries or for the provision of the families of deceased professors. But only a few, like that of Greifswald, possess property that yields considerable revenues, from which a large part of the costs of maintenance is defrayed. Others receive subsidies from independent public funds, that are devoted to special purposes, as for example Göttingen, from the Hannoverian monastic funds. As their own earnings we may also mention the proceeds arising from the clinical hospitals, and from certain fees or charges. By far the larger portion, however, of the total University expenses, is covered by direct State subsidies.

---

\*) Only for the training of Roman Catholic priests, there are, in addition to the theological faculties, institutions in the enjoyment of rights equal to those of the former.

2. The chief representative of the University is the Rector, or in some Universities the Prorector, especially where the reigning Sovereign, or, as in Göttingen, a Prince of the Royal House occupies the honorary position of Rector magnificentissimus. The Rector or managing Prorector is elected, by a process differing in the various Universities, by the total number of the ordinary professors (in Göttingen by a general meeting embracing also the extraordinary professors). He is chosen from their midst for one year, but the election requires to be confirmed by the ruling Sovereign. The Rector directs the current business and presides at the meetings of the Senate and of the various committees. In most Universities the Senate is composed, in addition to the Rector, of the latter's immediate predecessor, of the Deans of Faculties, of the Senators specially elected for one year by the ordinary professors, and of the University judge.

3. The Universities are divided, according to the chief branches of learning cultivated in them, into Faculties, the number of which, as is well known, was originally four, but is, at the present time, larger in several Universities, whereas Münster exceptionally possesses only three faculties. In four Universities (Bonn, Breslau, Tübingen, Strassburg) Protestant and Roman Catholic theological faculties exist side by side, while in Münster, Munich, Würzburg and Freiburg only Roman Catholic, and in the other Universities only Protestant theological faculties are found. From the philosophical faculty an independent one combining mathematics and natural science has branched off in Tübingen, Strassburg and Heidelberg, and in Tübingen, besides, a faculty of political science. In Munich, likewise, exists a special faculty of political economy. In Strassburg a faculty of law and political science combined was established in 1872, instead of the faculty of law; the same was done in Münster in 1902, and in Würzburg and Freiburg the faculty of law has been transformed into one of law and political science combined.

The faculties, in a narrower sense, are composed of the ordinary professors that belong to them, but, in a wider sense, of the total number of teachers and students of the respective branches of learning. The faculties superintend the instruction in their respective subjects, and are responsible for its regular operation and completeness. In the case of a vacancy of a chair they are allowed, partly by transmitted custom, partly by explicit regulations in their statutes, to propose to the Government persons fit and proper for

the succession. The admission of „Privatdocents“, in accordance with the regulations for qualification, is likewise the business of the faculties. Also the bestowal of academical degrees, although it takes place under the authority of the whole University, is exclusively a matter of the faculties. For conducting its business each faculty elects for one year a Dean from its members. The election has to be communicated to the Ministry.

The teaching-staff of the University is composed of ordinary professors, honorary professors, extraordinary professors, „privatdocents“, and lecturers (lectors), to whom must be added technical teachers and instructors of bodily exercises. In several Universities also „commissioned teachers“ are employed, who do not belong to the academical staff, and, as a rule, are admitted only for such subjects as are not represented in the ordinary curriculum.

4. The ordinary professors are appointed by the reigning Sovereign, on a motion of the Ministry, who, as a rule, take into consideration the proposals of the faculty. They are government officials, but in many respects occupy a special position. They form the real permanent teaching-staff of the University, and, as a rule, they alone have the right of voting, as occasion presents itself. From their midst also proceeds the representative, whom, according to the current constitutional regulations, the Universities delegate to the Diet of their State.

Each ordinary professor receives a teaching commission for a definite subject, but is entitled to deliver lectures on any subject within the scope of his faculty, and according to the statutes of some Universities, also on all branches of study that belong to other faculties. As a rule, he is explicitly bound only to announce a public (gratis) lecture or a gratis series of exercises as a special course (privatissimum) and a private lecture. The public lectures, which in older times formed the chief duty of the professors, are now-a-days delivered mostly in only one or two weekly hours.

The income of the professors, arising from their appointments, is regulated in a manner entirely different from that which prevails for other officials. In addition to a fixed salary they draw a honorarium for their private lectures, and fees for graduation and other examinations. As Rector and as Dean they have, besides, special sources of income.

The payment of the ordinary professors was rearranged in Prussia in the year 1897, on the principle of increase through length

of service. In Berlin the salary starts at 4800 M., in the other Universities at 4000 M., and rises in the former University by six, in the others by five four-yearly stages up to 7200 and 6000 M. respectively. In addition the professors receive an allowance for house-rent, which for Berlin amounts to 900 M., for the other Universities to 600 or 540 M., according to the size of the town. There further exists a fund at the disposal of the Minister, amounting to 175000 M. a year, out of which additional personal payments are made to specially distinguished teachers and investigators, more particularly on the occasion of a call to another University. The so-called normal maximum (in Berlin 9400 M., in the other Universities 7800 M., besides allowance for house-rent) may, however, be exceeded only by royal sanction.

5. With respect to the fees derived from lectures, a reform has been introduced in Prussia in 1897, by which it has been legally enacted that the honoraria of the salaried\*) (ordinary and extraordinary) professors, in so far as, after deducting the questorial expenses, they exceed 3000 M., in Berlin 4500 M., shall flow into the public treasury to the extent of one half. For professors already in function before that date, this regulation applies only by their own consent. It has been further enacted that these deductions from honoraria shall be collected into a special fund of expenditure, out of which are paid yearly allowances to salaried (ordinary and extraordinary) professors with inconsiderable incidental emoluments. By a clause in the state budget of 1902 the employment of this fund has been more precisely defined to the effect that the honoraria and other incidental emoluments rated under this head — especially graduation fees — shall be supplemented to the amount of 800 M., and that the remaining portion of the fund may be employed for special allowances to professors for a definite time, as a guarantee of fixed receipts of honoraria in the case of calls, and — up to the amount of 20000 M. — for the support of University teachers of every category.

With respect to the amount of the separate fees, it has been enacted, in the year 1898, in Prussia, that the rates hitherto levied (for lectures without experiments usually 5 M. per weekly hour) shall not be exceeded. In most other Universities a maximum has likewise been fixed. Impecunious students are allowed to postpone pay-

---

\*) salaried = *etatsmässig*, literally „budgetary“, whose salary is allowed for in the budget (Note of the translator).

ment of fees for a number of years in some Universities, in the others (in Prussia only in Marburg) payment is remitted entirely, or to the extent of one half.

6. Among the extraordinary professors a distinction is made between salaried and unsalaried\*) ones. The former are appointed permanently at a fixed salary, and are employed, partly to complete the instruction in the chief branches of study, partly to represent those subjects for which as yet no ordinary professorship exists in the respective Universities or elsewhere.

The unsalaried extraordinary professors draw no stipend, but some have a teaching commission, and receive in that case a remuneration. Formerly the nomination to an unpaid extraordinary professorship was made as an encouragement and recognition of a „privatdocent“ who had proved efficient. In Prussia, however, in more recent times, such nominations have become more and more rare, and successful „privatdocents“, as a rule, now simply receive the title of professor.

7. The salaried (ordinary and extraordinary) professors are not subject in Prussia to the regulations for superannuation that apply to other officials, but, in case of incapacity for professional duties, they are dispensed from delivering lectures with continuance of full salary, as well as of allowance for house-rent and of a share in the fees of the faculty. This favoured position is partly due to the fact that a portion of the official income of the professors consists of college fees, which cease with the discontinuance of actual teaching. In Jena and Rostock the professors are in the same position. In Leipzig the professors can be pensioned at their own request, and the amount of pension is, in that case, fixed by an arrangement between the Ministry and the petitioner. In Strassburg a retirement from active teaching takes place, which the professor can demand when he has reached the age of 65, or when he is deprived of the management of his institute. He then retains his proper salary, but with a deduction of the allowance, amounting to one fifth or one sixth. In Bavaria, Württemberg, Baden, and Hessen, the same regulations as to superannuation apply to professors as to other officials. In Bavaria the college fees are, in that case, considered as „additional receipts“, and hence the rate of pension is increased in the first official decade by one seventh, in the second by one eighth.

---

\*) *Vide* Note above (Note of the translator).

However, superannuation takes place, as a fact, only at the desire of the person concerned. In the case of Tübingen, in the computation of the pension, 2000 M. are counted in addition to the salary, as a compensation for the college fees, but the pension may not exceed the maximum of 6000 M.

8. With respect to the provision for the families of deceased salaried professors, there still exist, dating from former times, in the Prussian Universities, widow-funds, partly with considerable capital; but since 1889 no further contributions have been levied on members, but the state adds to the revenues of the capital a sum sufficient to allow payment of the fixed pensions of widows and orphans. These pensions, without regard to the duration of office of the deceased, amount for the widow of an ordinary professor to 1650 M., for one of an extraordinary professor to 1300 M., for the eldest child (up to its twenty-first completed year or till marriage) to 480 M., for each successive one to 300 M.; for one orphaned of both parents to 720 M., for each successive one to 480 M.

Also in the other Universities regulations exist for the provision for the families of deceased professors.

9. With respect to their disciplinary relations, the professors of the German Universities are subject to the regulations applicable to other officials in their State.

10. The „privatdocents“ are teachers who, after complying with certain regulations, are admitted to independent function, under the authority of and in the University. They may not only make use of the rooms of the University, but their lectures, attended by students, count for the latter in the same manner as those delivered by an ordinary professor. They also draw college fees in the same way as the professors, but in Prussia, when the amount should exceed the fixed limits, they would of course not be liable to the deduction ordained for the salaried professors. Sometimes they receive a teaching commission and, in that case, also a remuneration, but they have no claim to such a privilege, of which they can again at any time be deprived. In the Prussian and also in some other Universities, „privatdocents“ can also receive bursaries. In the Prussian educational estimates 60000 M. are set apart for this purpose. Each single one shall not receive more than a total of 6000 M., and this sum is, as a rule, spread over five years. When the official labours of the „privatdocent“ prove satisfactory, he receives, in Prussia, from the Minister, after some years, the title of professor, without passing

thereby, as in the case of appointment to unpaid extraordinary professor, into another category of University teachers.

The admission of a „privatdocent“, on the basis of the fulfilment of habilitation depends, in Prussia, merely on the faculty. The latter has only to forward a communication to the Minister, and to add particulars as to the career, the course of study, and the scientific labours of the new teacher. The candidate, however, has to accompany his application to the faculty with a certificate from the Curatorium that there are no objections to his habilitation. In other states the nomination rests with the Ministry, or even with the reigning Sovereign. They have nowhere the position of officials, but are nevertheless subject to the disciplinary power of the faculty and other courts, and especially in the case of a breach of duty or reprehensible conduct, they can be deprived of the *venia legendi*. The regulations as to disciplinary proceedings were formerly also different, according to the statutes of the single faculties of the Prussian Universities; now, however, they are uniformly defined by the law of June the 17th 1898, and in such a manner, namely, that the law of July the 21st 1852, as to the professional breaches of the non-judicial officials, together with the alterations according to the law of April the 9th 1879, in a number of its paragraphs, applies also to „privatdocents“, „when they act contrary to the duties imposed on them by their position, or when, by their conduct in and outside their profession, they prove unworthy of the esteem, consideration, or confidence required by their position“. The disciplinary penalties are regulatory punishments, and deprivation of the character as „privatdocent“. The deciding disciplinary authority in the first instance is the faculty. Against their decision recourse may be had to appeal to the Ministry of State, which can form its resolution only after receipt of the report of the disciplinary court.

When one wishes to habilitate in the Roman Catholic theological faculties, he requires, for this purpose, also the consent of his bishop. With respect to the requirements for habilitation, they consist, fairly uniformly, in the possession by the candidate of the doctor's degree of the faculty concerned, or, as theologian, at least that of the licenciate degree; further in the submission of a scientific essay as subject of habilitation, and in a specimen lecture in the faculty, which is followed by an oral examination in his subject, under the name of colloquium. The application for habilitation is admissible only two or three years after the time prescribed for Uni-

versity studies; the medical faculties demand besides the production of qualification as physician.

The right of the „privatdocent“ of delivering lectures extends only to the subjects for which he has qualified himself. In some Universities the „privatdocents“ are obliged to announce in each semester a course of lectures or of exercises. In the Prussian Universities this is not the case; here also they do not require, as the professors do, any permission to absent themselves for more than three days from the University town, but they have to give intimation of the fact to the Rector and to the Dean. When the „privatdocent“ has announced no lecture for two semesters, after having been called upon to do so, his rights, in the Prussian Universities, are suspended, in others they are cancelled altogether.

11. The lecturers (lectōrs) are originally teachers of modern languages, who have to impart a more scholastic, practical instruction. In more recent times their functions have frequently assumed a more scientific form, so that they are employed to complete the instruction of the respective ordinary professors. They are appointed by the Minister, not permanently, but mostly only for a short time, with the possibility of continuance, and hence also they receive no salary, but only a remuneration, and also fees for their private lectures. In some Universities there are also teachers of more technical subjects, such as stenography, who are likewise termed lecturers (lectors). Music and drawing are not uncommonly represented by teachers with the rank of extraordinary professors.

The assistants have no independent tutorial functions, but are only subsidiary organs of the professor. Yet, occasionally, they are entrusted, in the seminaries, under the authority of the professor, with conducting exercises for beginners.

As so-called teachers of bodily exercises (Exerzitiemeister) there are, in all the Universities, fencing masters, in most of them also riding and dancing masters.

12. Only those persons who have matriculated are considered as students, properly so called, of the Universities. In addition there are authorised hearers and temporary auditors, who have been admitted by the Rector to attend lectures with the consent of the teacher. The normal qualification for immatriculation is the possession of a leaving-certificate of a higher educational institution with nine classes. Formerly, in most Universities, only those who had obtained a leaving-certificate of a Gymnasium were entitled to full immatricu-

lation. Since 1901, in Prussia, those with leaving-certificates of a German Realgymnasium and of a Prussian Higher Realschule, or of a German one that is on an equal footing with the latter, are admitted, not only to the study of all the branches of higher instruction, but also to enter into the faculty of law, when it is left to their own responsibility to acquire the necessary knowledge of the classical languages. The regulation of the medical examination is an imperial concern, and was lastly effected by a resolution of the Federal Council of May the 28th 1901. According to this, the leaving-certificate also of a German Realgymnasium is recognised for the whole Empire as sufficient for admission to the study of medicine, so that a knowledge of Greek is no longer unconditionally demanded. Those, however, who possess only the leaving-certificate of a Higher Realschule cannot be admitted, without further preliminaries, to the medical examination, nor can they, in Prussia, at once be enrolled in the medical faculties, but they must, in a previous supplementary examination, give evidence of possessing a knowledge of Latin, to the extent required of the pupils of a Realgymnasium. Only for the study of theology, Protestant as well as Roman Catholic, the leaving-certificate of a classical Gymnasium continues to be, also in Prussia, a necessary condition.

In addition to the full immatriculation, there is a so-called „little“ immatriculation, for which no leaving-certificate is required, but only some other kind of evidence of the existence of an education sufficient for following the lectures.

Foreigners can matriculate in all the faculties, on showing sufficient previous schooling. Certain classes of persons, namely state and municipal officials, and people engaged in business, cannot matriculate at all, but may be admitted as temporary hearers. In Baden and Bavaria, women in possession of a leaving-certificate can matriculate on an equal footing with the male students.

13. In addition to the fees for private lectures, the students have to pay certain contributions, that flow into the University treasury, such as lecture-room fees, contributions to institutes (to be discharged by those who make use of the government institutes for medicine and natural science), payments for practical experiments (levied for those exercises which, on the part of those that share in them, entail a consumption of materials at the charge of the University). For these (usually moderate) contributions no delay or remission of payment, as in the case of lecture fees, is allowable. For indigent

students there exist bursaries, in many Universities in large numbers, derived from considerable endowments. Boarding establishments for students are found in the Roman Catholic theological faculties, not as actual University institutions, but as episcopal boarding seminaries. In Tübingen there is also a Protestant theological boarding establishment, the celebrated ecclesiastical foundation (Stift).

In order to encourage the students to make scientific investigations of their own, prize-essays are proposed by all the faculties. The prizes are partly provided by the government, partly based on endowments.

The usual exit from the University takes place by exmatriculation, together with the granting of a certificate of leaving. As a penal measure, removal from the University (*consilium abeundi*) and entire exclusion from University studies (*Relegation*) are sometimes resorted to. In most Universities a six-monthly voluntary absence from the University town entails loss of academical citizenship. Whoever does not engage himself, in one semester, for at least one private lecture, loses this semester of his course, and can also be struck off the list of students, or removed from the University by disciplinary process.

14. To a certain extent, the obtaining of the academical degree constitutes the theoretical conclusion of the University course. In Germany such degrees have now a practical importance only for those who intend to devote themselves to an academical career, as the examinations appertaining thereto do not possess, as in France and other countries, at the same time, the validity of state examinations for the entrance into a learned profession. One can become a clergyman, a judge, a barrister, a physician, a higher-school teacher, without possessing an academical title. Only in the case of some professions not regulated by the State, as, for instance, in that of a technical chemist, the acquirement of the doctor's degree serves as evidence of scientific schooling. For the rest, the large number of graduations, which still take place every year, is explained by the consideration which the title enjoys of old in public estimation, and by the wide-spread partiality in Germany for titles in general, among physicians also by the endeavour to be marked off from quacks. Only in the theological faculties there are still two academical degrees, the lower one of *licenciate*, and the higher one of *doctor*. In the others only the doctor's degree has been retained, and the preliminary grade of „*magister liberalium artium*“, which still occurs in more recent times in the philosophical faculty, has now likewise en-

tirely disappeared. In Bonn, it is true, there still exists an examination for „Magister“, side by side with the proper doctor's examination, but it is inseparably connected with the latter, and cannot be passed alone.

The degree of licentiate suffices, in the theological faculties, also for habilitation as „privatdocent“. The dignity of doctor is mostly bestowed in them only honoris causa, i. e. without examination or fees, on recognised scholars, or other men of distinguished merit.

Matters of graduation are regulated, partly by the statutes of the separate faculties, partly by dispositions specially sanctioned by the Ministry. Only a few decades ago the abuse existed in some faculties of making the aquirement of the doctor's degree excessively easy, so that the payment of the required fees appeared almost the chief business. In some, graduation „in absentia“ was permissible, namely, without oral examination, and merely in virtue of a dissertation that was forwarded, but did not require to be printed. In others only an oral examination was required, others again, it is true, demanded moreover a written essay, but not its publication in print. With reference also to the previous schooling of the candidates, the requirements were partly insufficient. In more recent times essential reforms have been carried out in this respect, especially by the endeavours of the Prussian educational administration, which has brought about agreements with the governments of the other Federal States as to certain minimum requirements for graduation. A doctor's title that has not been obtained in virtue of an oral examination and of a printed dissertation, is not recognised at all in Prussia. These conditions are now also enforced by almost all the faculties outside Prussia, only by a few still with admission of exceptions. Likewise, not only almost all Prussian faculties, but also most of the non-Prussian ones, demand unconditionally the certificate of maturity of a school with nine classes. In recent times, however, the number of admissions from the Realgymnasium and the Higher Realschule, apart from those from the Gymnasium, has continually increased.

The customary formal ceremony of graduation, with public disputation, common in former times, has been abolished in most of the Universities.

\*) Including Braunsberg (Prussia).

#### 4. Other Public Academical Institutions.

1. Roman Catholic Theological Institutions. — In Prussia there exists, under the name of „Lyceum Hosianum“ in Braunsberg, a Roman Catholic theological faculty, with the addition of a philosophical faculty, as a State institution, chiefly for the purpose of training the Roman Catholic clergy of the diocese of Ermland. The institution was established in its present form in 1818. The theological faculty has now four ordinary professors, one ordinary honorary professor, one extraordinary professor, and three privatdoctents. To the philosophical faculty belong three ordinary professors, one extraordinary professor, and one lecturer for the Polish language. The professors have the rank and salary of University professors, but no

honoraria for lectures; nor have the faculties the right of conferring degrees. The number of students averages about 50, the yearly estimates of expenditure amount to 62 321 M.

Further there exist in Prussia seven Episcopal Seminaries (in Fulda, Paderborn, Pelplin, Posen, Trier, Limburg, Osnabrück), that have the character of Roman Catholic theological faculties, and in which the clergy of the respective dioceses can carry on their studies. Outside Prussia such „Clerical Seminaries“ are found also in Mainz and Metz.

In Bavaria, besides the two Rom. Cath. theological faculties in Munich and Würzburg, there are five (formerly six) governmental and one episcopal Rom. Cath. theological Lyceum.

2. The „Kaiser-Wilhelms-Academy“ in Berlin is devoted to the training of army-surgeons. The number of students admitted into the institution is 300. They receive free lodging and a monthly allowance; they attend the lectures in the University, like other medical students, but receive in addition repetitive instruction in the most important subjects.

3. The „Royal Academy“ in Posen, opened in 1903, is not intended specially for the tuition of young people, but arranges lectures and exercises for a wider circle, besides scientific extension-courses for physicians, lawyers, officers, etc. For the winter semester of 1903/04, 1148 hearers were enrolled, with a total of 88 weekly hours of lecturing.

4. Scientific Institutions and Lectures in Hamburg. — The directors of the Hamburg scientific institutions (town library, botanical garden, observatory, government chemical laboratory, government physical laboratory, museum of natural history, museum of art and industry, collection of Hamburg antiquities, ethnological museum, botanical museum, and laboratory for analysing mercantile wares) are obliged to deliver regular lectures on scientific subjects. Since 1896 this obligation has also extended to the assistants in these institutions. Besides, means are granted to the chief school authorities for the appointment of scholars charged with the delivery of permanent lectures, or with conducting courses of various length. Thus, in the winter semester of 1902/03, 119 courses in all branches of science were conducted by 97 teachers, with a total number of 58 428 hearers. These lectures are delivered gratis, with a few exceptions (such as those of the extension-courses for physicians, and the courses in the pharmaceutic institution).

5. The Royal Institute of Experimental Therapeutics in Frankfort on the Main has in the first place the task of testing and developing the more recent therapeutic methods, but further also the obligatory control of the various kinds of curative serum (for diphtheria, tetanus, etc.). However, the institution can also, within certain limits, serve as a teaching establishment, by arranging courses for a restricted number of physicians. For this purpose negotiations have been entered into with the town of Frankfort.

6. The Academy of Practical Medicine in Cologne, in connection with the local hospitals, is devoted to the further scientific training of physicians, and especially to affording also young medical men an additional opportunity to complete, after the passing of their State examination, the one year's practice prescribed by the regulation of 1901. A similar institution will shortly be opened also in Düsseldorf and, in course of time, probably in other towns.

7. In this place may still be mentioned the learned Societies that have the character of State institutions, and are in closer connection with the Universities, at least in so far as the preponderating majority of their ordinary members are at the same time professors at the Universities of the towns in which they have their seats. Such are the Royal Academies of Science in Berlin and in Munich, and the Royal Societies of Science in Göttingen and in Leipzig.

8. Among private institutions and foundations the following may still be mentioned here.

In Berlin: the Association for Extended Instruction in Political Science, destined chiefly for the further training of officials and lawyers.

The Humboldt-Academy, a popular high-school for both sexes.

The Berlin University Teachers' Union for Popular Courses pursues aims similar to those of the „University Extension“ in England. Also other Universities have arranged such courses.

The Lessing High School, founded in 1901 by the Lessing Society, and the Free High School, established in 1902, have likewise the aims of a people's University.

In Frankfort on the Main: the Senckenberg Foundation, established in 1763 by the physician doctor Senckenberg, owns an important pathologic-anatomical institute, a botanic garden, and a

scientific library. In winter, lectures and demonstrations are held for physicians, who also find constant opportunities for scientific work in the institute. Lectures on botany are delivered in winter and in summer.

The Senckenberg Society of Natural Science, and the Physical Union are learned societies which, at the same time, arrange for lectures and practical courses. Also the Free German Higher Collegiate Foundation (Freies Deutsches Hochstift) organises courses and single lectures.

In Dresden, the Gehe Foundation, established and richly endowed by F. S. Gehe, a merchant who died in 1882, extends its educational sphere of action chiefly to political economy and political science. Three teachers are permanently appointed, and besides every winter several single lectures are delivered by scholars from elsewhere.

## II. SECONDARY SCHOOLS.

### 1. The Higher Educational Institutions in Germany.

The name of „Higher Educational Institutions“ is, in Prussia, bestowed on those schools that form the connecting link between the elementary schools on the one hand, and the universities and other higher colleges on the other. In the south German states these institutions, corresponding to the French „*écoles secondaires*“, are often called „middle-class schools“, whereas in Prussia by middle-class schools are understood higher elementary schools. There are three kinds of complete higher educational institutions, viz. Gymnasia, Realgymnasia, and Higher Realschulen, and to these correspond three kinds of incomplete institutions viz. Progymnasia, Realprogymnasia, and Realschulen. The complete institutions have nine classes, the Latin names of which — sexta, quinta, etc. up to prima, still recall the original existence of only six classes. But long before, the two upper classes of the Gymnasia had a two-years' course, and thus arose a lower and upper prima and a lower and upper secunda. Since the fifth decade of the last century a partition also of the tertia into a lower and an upper division was generally introduced, and thus the number of classes was increased to nine. In Württemberg it even amounts to ten. Besides in all the federal states these schools have preparatory classes.

The Gymnasia owe their origin to the old Latin schools, and have gradually developed themselves, since the time of the Reformation, so as to acquire their present shape. Down to most recent

times they were the only institutions that possessed the right of preparing for University studies. The teaching in them always laid the main stress on the two classical languages, yet, in the course of the nineteenth century, a position of their own was assigned to the so-called practical subjects.

In the second half of the eighteenth century there arose Realschulen or „Higher Burgherschools“, as educational institutions originally not for the learned professions, but only for civil and commercial life. The classical languages were replaced in them by French and English, and special stress was laid on mathematics and natural science. The course was at first a much shorter one than that of the Gymnasium, but gradually institutions were developed with a larger number of classes, in which instruction was also given, to a moderate extent, in Latin, but not in Greek. These schools received in Prussia, in 1832, a more definite organisation, and at the same time a leaving or final examination was introduced into them, by which admission to certain higher studies was obtained.

These schools then received a new regulation in the year 1859, and the complete institutions with nine classes were designated „Realschulen of the first order“. Beside these there were also Realschulen of the second order, some of which had no Latin in their curriculum. This system of Realschulen without Latin was then further developed, and in the year 1882 on schools of this kind, with nine classes, the designation was bestowed, in Prussia, of „Higher Realschulen“. They sprung from the „industrial“ schools, but are essentially distinguished from the latter by the fact that they are not technical professional schools, but institutions for general culture by means of instruction in languages, history, mathematics, and natural science.

In 1882, the Realschulen of the first order, with teaching of Latin, received generally, in Prussia, the name of Realgymnasien, a designation that had already before occurred in other federal states.

The incomplete institutions are without the three upper classes; for the rest their curriculum corresponds to that of the six lower classes of the complete institutions. The course is arranged in such a manner as to afford, to some extent, a well-rounded education.

The time-tables established in the year 1901, and now in force in Prussia, are the following:

## I. Time-table of the Gymnasia.

The brackets indicate the admission of a temporary shifting of the number of hours within the several groups of subjects.

	VI	V	IV	LIII	UIII	LII	UII	LI	UI	Total

To the Realschulen applies the Time-table of the Higher Realschulen (see III.) from VI to L. II inclusively. Their III corresponds to the L. III, their II to the U III, and their I to the L. II of the Higher Realschulen.

According to local requirements this time-table may, within certain limits, be modified, at the discretion of the supervising authorities, but without an increase in the number of hours. One of the possible forms of such is time-table shown in IV.

## III. Time-table of the Higher Realschulen.

The leaving or final examination, which takes place when the pupil has passed through the upper prima, forms the completion of the course of instruction in each of the three kinds of higher-class schools.

The leaving examination is conducted by written papers and orally.

The written examination comprises, for all the schools, a German essay and the working of four mathematical questions, each dealing with a different branch; further:

- a) for the *Gymnasia*: a translation from German into Latin, and another from Greek into German. Those pupils who take Hebrew, have to give in a German translation of an easier passage from the Old Testament with grammatical explanations;
- b) for the *Realgymnasia*: a translation from Latin into German; according to the curriculum of each separate institution, a French or an English piece of work, and namely either an essay or a translation from German; and the treatment of a question in physics;
- c) for the *Higher Realschulen*: a French and a English piece of work, and namely in one of these two languages an essay, in the other a translation from German; and the treatment of a question in physics or in chemistry.

The oral examination comprises, for all the schools, Christian religious teaching, history, mathematics, and further:

- a) for the *Gymnasia*: Latin, Greek, and according to the curriculum of each separate institution, either French or English;
- b) for the *Realgymnasia*: Latin, French, and English; and physics or chemistry;
- c) for the *Higher Realschulen*: French and English, and physics or chemistry.

The requirements correspond with the program of instruction of the *prima*. So, e. g., for

Greek, in the *Gymnasium*: Reading: Homer's *Iliad*, Sophocles (also Euripides), and Plato; besides, Thucydides, Demosthenes, and other prose valuable on account of its subject-matter; also appropriate specimens of Greek lyric poetry.

Grammar, revisals and recapitulations of the whole subject, as found necessary.

Practice in unseen translation. Written translations from and into Greek.

Latin, in the *Gymnasium*: Reading 5 hours: Orations of Cicero (e. g. in *Verrem* IV or V, *pro Plancio*, *pro Sestio*, all with omissions, *pro Murena*), selections from Cicero's philosophical and rhetorical writings, also from his letters; Tacitus' *Germania* (at least till Chapt. 27), also *Agricola* or parts of the *Dialogus*, selections from the *Annales* (especially the sections referring to Germany) and from the *Histories*; selections from Horace, learning by heart of some of

the Odes. Occasionally, unseen translation. Private reading, especially also of writers read in previous classes, is to be encouraged and fostered, but is not required as obligatory.

Grammar 2 hours: revisals with special attention to the more important and difficult syntactical rules; recapitulating explanations of specially prominent stylistic peculiarities.

Translation into Latin, written class and home exercises.

Latin, in the Realgymnasium: Reading: easier Orations of Cicero (e. g. *pro Sex. Roscio, in Catilinam, de imperio Cn. Pompei*); select sections from Livy; passages of Virgil's *Aeneid* in a selection presenting complete pictures and allowing a view of the whole work; in U. I also easier Odes of Horace, and sections of Tacitus' *Germania*.

Grammar: wherever its treatment is required in the course of reading.

Every three or four weeks a written translation into German.

French, in the Gymnasium: Reading occupies a central position in the whole course. Study of sterling modern prose writings in different departments, if possible also of a classical tragedy and a modern comedy, but in any case of one of the greater of Molière's comedies.

Revisal and completion of the syntactical material, with oral and written exercises. Study of synonyms, style, and metre, as required, in connection with the reading.

Conversational exercises, not merely in connection with the reading, every hour; likewise revisal and extension of the stock of words and phrases previously acquired.

French, in the Realgymnasium: The reading, which, as in the Gymnasium, occupies a central position, is treated more extensively and intensively than in the latter, so that the pupils may acquire a wider notion of the special qualities of French literature in the last centuries, as well as some knowledge of the national culture and character.

Revisal and completion of the more important sections of the grammar. An outline of the laws of versification. The indispensable essentials of synonymy and of the laws of style. Extension of the vocabulary, including also technical and scientific terms.

Written and oral exercises. Guidance in essay-writing, from frequent brief reproduction of what has been read, up to a freer treatment of definite concrete subjects. Conversational exercises in

every hour, not merely in connection with the reading and incidents of daily life, but also on history, literature, and culture of the French nation.

French, in the Higher Realschule: In these schools the teaching aims at imparting a knowledge of the more important French writings of the last three centuries, insight into the grammatical system of the language, some knowledge of the most important sections of French literary and social history, and practice in speaking and writing.

English, in the Gymnasium: Generally, the teaching aims at sureness of pronunciation, based on a firm command of the forms, at a knowledge of the more essential syntactical rules, and at a sufficient vocabulary, all based on practice in the oral and written use of the language; also at understanding some of the easier writers.

The practical knowledge thus acquired is intended to serve as a basis for further study. The chief syntactical rules are to be treated inductively according to a brief compendium, everything else to be discussed in connection with the reading. At first a „reader“ may be used, but at least during the last year an appropriate author is to be read.

English, in the Realgymnasium: Here the aim is the understanding of the most important writings since Shakspeare, as well as the oral and written use of the language.

Reading occupies a central position during the whole course. It comprises sterling modern prose writings in various departments, also specimens of oratory, and appropriate poems, especially select Shakspearean dramas. Special attention is to be paid to the pupil acquiring an idea of the particular character of English literature since Shakspeare in its chief forms. Study of synonyms, style, and metre, as required, in connection with the reading.

English, in the Higher Realschule: The aims of the teaching are here essentially the same as in the Realgymnasium. The larger amount of available time has to be devoted to a stricter grammatical training, to more comprehensive reading, and to more extended oral and written exercises; the latter may be, more so than in the Realgymnasium, of an imitative character, and moreover extend to concrete technical subjects, letters, etc. Special stress should be laid on pointing out the peculiarities of the English idiom, and on the acquirement of a more extensive, also technical, vocabulary.

The grammatical exercises comprise revisal, enlarging and deepening of previous grammatical practice, all in connection with the reading and the written work.

Arithmetic and Mathematics, in the *Gymnasium*:

Arithmetic: Arithmetical Progression of the first Order and Geometrical Progression, Compound Interest and Annuities. Elements of the theory of Combinations and its more immediate application to the theory of Probability. The Binomial Theorem for Positive Integral Exponents. Repetitive continuation of the arithmetical course (extension of the notion of numbers by algebraical operations, from the positive integral to the complex number). Equations, also of the higher degree, that may be reduced to quadratics.

Continuation of the exercises in Trigonometry and in solving questions in Planimetical constructions.

Stereometry and its application to mathematical geography and astronomy; Instruction in perspective drawing of objects in space.

The theory of Coördinates. Elements of Conic Sections.

Revisal, recapitulation, and exercises in all branches of the subject taught in previous classes.

Arithmetic and Mathematics, in the *Realgymnasium* and *Higher Realschule*:

Arithmetic: theory of Combinations, and application to the theory of Probability. The Binomial Theorem for any Exponents, and the simplest Infinite Series. Repetitive continuation of the arithmetical course (extension of the notion of numbers by algebraical operations, from the positive integral to the complex number). Cubic equations. Elementary exercises in Maxima and Minima.

Spherical Trigonometry with application to mathematical geography and astronomy.

Geometry: elements of Descriptive Geometry. The most important problems in Conic Sections in elementary-synthetical treatment. Analytical Plane Geometry.

Revisal, recapitulation, and exercises in all branches of the subject taught in previous classes.

In the incomplete institutions, at the end of the sixth yearly course, a final examination is held, by which it is ascertained whether the pupil has reached the degree of maturity requisite for the *Upper Secunda* of the corresponding complete institution.

In Prussia, according to a rescript of the Emperor William II, of November the 26th 1900, the education imparted in the three kinds of institutions is considered as of equal value. Hence the former preference enjoyed by the leaving-certificate of the Gymnasium, which alone entitled the possessor to admission to University studies, has, at least in Prussia, been almost entirely abolished. Only for the study of theology the previous schooling of the Gymnasium is still exclusively required; to the study of medicine also the holders of leaving-certificates of a Realgymnasium are admitted; to the study of law and to the course for higher-class teachers, in Prussia, not only those, but also the pupils of the Higher Realschulen. The necessary knowledge of Latin they must acquire by private study. If they wish to study medicine, they must previously pass a special examination in Latin. This special provision for medicine is based on the fact that the regulation of the medical examination is, as is not the case with that for law students, a matter for the Empire, and not for the separate States. The other Federal States, however, have as yet not followed the example of Prussia with reference to the complete equalisation of the three kinds of institutions.

The higher educational institutions are partly State, partly communal establishments. Many of the latter, however, receive subsidies from the State treasury. The teachers have the character of direct or — at the communal institutions — of indirect state-officials. Hence, when once appointed, they can be discharged only by sentence of a disciplinary court, and have a claim to retiring pension and to provision for the family they leave behind.

The permanently appointed, academically trained teachers are called „Oberlehrer“ (senior masters), a number of them also have the title of „Professor“. Before their definite appointment they are employed as „Hülfslehrer“ (assistant masters). He who wishes to become senior master, must have studied at least three years in a University (in reality the time of study mostly lasts four years or longer), and have passed a State examination. According to the Prussian regulations for examination of 1898, he must acquire the qualification, for at least one subject, for the three higher classes, and the qualification for two other subjects for the middle classes (up to lower secunda inclusively). After passing the examination, the candidates must employ one year in actual teaching, in a higher-class school, as „seminarists“, and another year as „Probekandidaten“ (probationary assistants).

The salary of the senior masters starts, in Prussia, at 2700 M., and rises, by seven three-yearly stages, to 6000 M. In addition, they receive an allowance for house-rent, which, in the larger towns, amounts to 660 M., and in Berlin to 900 M. The salary of the rectors of institutions rises to 7200 M. Besides they mostly have a free house or a corresponding compensation for rent.

### 3. Cadet-Schools.

For the general scientific training of future officers, there are in Prussia, Bavaria, and Saxony a number of Cadet-schools. Three of them are higher educational institutions, with boarding establishments, and with the curriculum of the Realgymnasia, combined with military practice. The pupils can withdraw at any time, and have in that case the qualifications attached to the class through which they have passed. On finishing the upper secunda (the third highest class), all the cadets have to present themselves for the ensign examination, and when successful, they can enter either the active military service, or the prima (the highest class), so as afterwards to pass the final examination; this latter alternative has certain advantages combined with it. In addition to the two highest classes (upper and lower prima), the chief institution for cadets in Grosslichterfelde has also an extra class, which is arranged as a military school. There are also several military schools forming independent institutions, and all ensigns must complete a nine months' course in one of these, and pass a further examination, before they can be promoted to the rank of lieutenant. Besides the chief institution for cadets in Grosslichterfelde (near Berlin), there are in Prussia eight preparatory institutions with classes sexta to upper tertia, whereas in the chief institution are found also the middle and upper classes. The number of pupils in the chief institution is 1000, in the preparatory institutions altogether 2470. There is free schooling for 135 pupils, and besides a large number of vacancies with very small payments of fees. The teaching staff consists partly of officers, partly of civil instructors. The total expenditure of the Prussian Cadet-schools, according to the estimates of 1903/04, amounted to 3 109 392 M. The Bavarian Cadet-School in Munich has 210, the one in Saxony, in Dresden, 226 pupils who pay no fees.

Only a minority of officers, however, proceed from the Cadet-schools. For the admission to the ensign examination it suffices if the candidate has passed successfully through the lower prima (the second highest class) of any secondary school.

---

### III. GIRLS' SCHOOLS.

#### 1. Organisation of the Higher Girls' Schools.

The elementary teaching of girls in the primary schools is organised, in Germany, in exactly the same manner as that of boys. For girls also compulsory education begins at the age of six, and continues, in most of the Federal States, to the age of fourteen, in some only to the end of the thirteenth year. In addition to the ordinary primary schools, there are also for girls, in many towns, Higher Elementary Schools, so-called Middle-class Schools. Further particulars on these are found also in the section dealing with Elementary education, to which the reader is referred. But the present section will treat of the Higher Girls' Schools and other special branches of the education of women.

The establishment and management of Higher Girls' Schools, in Germany, was for a long time left exclusively to private enterprise, and in the Roman Catholic parts of the country they were prevalently in the hands of conventual institutions. Not till the third decade of the last century were public Higher Girls' Schools established as municipal institutions, but still in comparatively small numbers. State regulations as to the organisation, course of instruction, and inspection of these schools have been issued in more recent times, and are in general less incisive than those applying to boys' schools. Three quarters of the Higher Girls' Schools are still under private management. As a rule, the Higher Girls' Schools that are not exclusively boarding-schools, supply also elementary education. The children

enter the lowest class, or the lowest of the preparatory school, at their sixth year, and pass through a nine or ten years' course. In Prussia the normal duration of the course is nine years, but with the addition of an extra class with optional subjects. According to the Prussian regulations of 1894, the time-table is the following.

Class	Lower Division			Middle Division			Upper Division			Total
	IX	VIII	VII	VI	V	IV	III	II	I	
1. Religion . .	3	3	3	3	3	3	2	2	2	24

Total	18	20	22	28	30	30	30	30	30	238

Two pedagogical points of view have specially determined the arrangement of the curriculum. In the selection and treatment of the whole of the subjects of instruction stress is to be laid on what is practical and stimulating. Hence, particularly, and more so than had been the case before, the circumstances of the present time are to be considered. Summaries with a number of names and dates, that have no personal or stimulating interest, and that can be received by the memory only in a mechanical way, are most strictly to be avoided. This applies especially to the teaching of history, the principal features of which are the following.

In classes IV and V: episodes from German history down to modern times, German sagas. In class III: the main facts of Greek and Roman history, with particular attention to intellectual life, as much as possible in the form of object-lessons, especially in connection with Greek art during the Periclean, with Roman civilisation during the Augustan, age. Romans and Germans. In class II: German history

to the Peace of Westphalia, special stress being laid on what refers to intellectual matters, and to the manner of life of women in Germany. In class I: continuation of German history, from the Peace of Westphalia down to modern times, with increased attention to Brandenburg-Prussian history (Frederick William I, the time of Frederick the Great, the period of the French Revolution, of Napoleonic rule, of the Wars of Liberation, the struggles of 1864, 1866, 1870—71, the unification of Germany, the new Empire and its development). Short views of the history of England, France, Italy, Austria, and the United States.

For the two foreign languages the aims in view are as follows.

The immediate object of the teaching of the foreign languages is that of enabling the pupil to understand an easier French or English writer, to grasp readily the meaning when English and French are spoken, and to use the foreign language with some facility, both orally and in writing, when applied to the simple forms of everyday intercourse. The more indirect aim of the teaching is that of introducing the pupils to an appreciation, as far as possible, of the mental and material development, and of the manners and customs, of the two foreign nations.

Reading occupies a central position during the whole course. Grammar is not taught systematically from the beginning, but is deduced from the reading, and gradually built up from concrete observations. Practice in speaking plays a great part from the outset. The whole method presupposes in the teacher both perfect facility in the handling of the language, and a certain amount of phonetic schooling, together with the ability of deriving practical help in the teaching from the results of historical linguistic study. The extent of a pupil's acquirements is estimated very much less by the greater or slighter facility in translating a German text into the foreign language, than by the ease and rapidity with which the meaning of a foreign text is grasped.

The male teachers in the Higher Girls' Schools are partly academically trained senior masters (Oberlehrer), with qualification to teach in secondary schools, partly taken from among the elementary teachers, but in that case they must have passed the examination for the intermediate schools. But in the majority of the institutions, especially in the private ones, female teachers are employed. Also for the latter examinations are prescribed, for which the necessary

knowledge is acquired mostly in teachers' seminaries, many of which, however, are not government establishments, but under municipal or private control. According to the regulations in force in Prussia, the examination of the elementary female teachers is distinguished from that of the teachers in the intermediate and higher Girls' Schools, by the fact that for the latter the acquirements in history and German literature extend somewhat further, and that French and English are added as subjects of examination. Also a special examination can be passed in these subjects. For the elementary female teachers English, as a subject of instruction, is optional, French obligatory, but they are not required to be examined in them. As an introduction to the seminary there are in Prussia a few preparatory schools with a two years' course. Other States have also for female teachers preparatory institutions of the same character as those for the male teachers.

The curriculum of the three years' seminary courses for female teachers in the intermediate and higher Girls' Schools in Prussia is the following.

	I.	II.	III.	Total
Religion . . . . .	2	2	2	6
German . . . . .	4	4	4	12
French . . . . .	4	4	4	12
English . . . . .	4	4	4	12

History . . . . .	2	2	3	7
Geography . . . . .	2	1	1	4
Natural History and Physics . . . . .	2	2	3	7
Pedagogy <sup>1)</sup> . . . . .	6	3	2	11
Drawing . . . . .	—	1	2	3
Writing <sup>2)</sup> . . . . .	—	1/2	1/2	1
Needlework . . . . .	—	1	1	2
Singing <sup>3)</sup> . . . . .	2	2	2	6
Gymnastics . . . . .	1	1	1	3
Total	30 + 1	28 1/2 + 1	30 1/2 + 1	

1) Besides one weekly hour of attendance at class teaching, and 5 groups of seminary practice with pupils.

2) 1/2 hour = 1 hour every fortnight.

3) There are three weekly hours of piano, violin, and organ, in which the seminary pupils take part alternately.

In Prussia a special scientific examination was introduced in 1900, on passing which the female teachers acquire the position of senior mistress (Oberlehrerin). The candidates must possess the qualification for the Higher Girls' Schools, and must have been practically employed in such a school for at least five years. For their scientific preparation special extension courses extending over 5 to 6 semesters are held in several Universities.

In most recent times Gymnasium and Realgymnasium courses have been established in several towns, enabling the pupils to obtain the leaving-certificate that qualifies for the University. However, in Prussia and in other Federal States, women provided with the certificate are not directly immatriculated as yet, but merely admitted to hear lectures.

As special branches of girls' education are still to be mentioned the general extension courses and the teaching of domestic economy. By the former is meant, not the technical (industrial or commercial) extended instruction, but the strengthening and completion of the education acquired by girls in the elementary school. In several of the Federal States this instruction is obligatory, or can be made so by the communities for two more years. Every week a few evening or Sunday hours are devoted to it. In Prussia there is no obligatory extended teaching for girls, but schools for the purpose have been established by several towns and by societies of general utility. Domestic economy is taught in connection with the extension courses, but is also given separately in the institutions of the municipalities or of the societies. The subjects are cookery, washing, ironing, hygienics, knowledge of alimentary substances, etc.

## IV. ELEMENTARY SCHOOLS.

### 1. A General View of the Elementary Schools in Germany.

When the Elementary School as a whole forms the subject of the following remarks, it must be pointed out, to the foreigner especially, that in Germany the school is by no means an imperial institution, but that it is managed independently by each separate State. There is no imperial Ministry for public education. Yet the general character and aim of the schools, the training and duties of the teachers, are the same throughout Germany. With reference to the outward circumstances, there are considerable differences between the several Federal States, nay between the parts of one and the same State. The presentation of a concise view of German school education is rendered difficult, especially by the absence of uniform school statistics for the whole German Empire, and by the fact that the statistics of the several States refer to different periods, and are drawn up on different principles.

Before examining the several departments of the statistics, we shall endeavour to describe the general features that characterise the Prussian and the German elementary school system, and which distinguish the latter from that of other civilised nations.

As was observed before, uniformity in the outward arrangements of the Elementary Schools is not to be found. The dissimilarity is naturally great between the village school with its one class, in sparsely populated districts, and the municipal school with its splendid buildings and all modern improvements, in the larger towns. Centralisation of the whole elementary school system exists neither in the German Empire as such, nor in the single States, and although the latter exercise control over each subdivision of the system, yet they allow the local authorities considerable latitude in the management of the schools. Of this latitude advantage has been taken, to a large extent, by the German towns, and among them by

the wealthy communities, so that, largely at the expense of the rate-payers, schools have arisen that may vie with the best in other countries.

Down to the present time, the school system in some German States, and among them, in the largest one, the Kingdom of Prussia, has not been regulated by comprehensive, uniform legislation. In Prussia, it is true, legal regulations have been applied to important branches of the elementary school system, but many questions remain which, even at the present day, are settled by dispositions of the provincial governments, and by decrees of the Minister of public education. Although, in many respects, the introduction of uniform school legislation for all parts of the country is much to be desired, yet its absence has not been without some salutary results. For, under the circumstances, local authorities have been enabled to introduce inexpensive experiments and improvements in smaller, limited districts, which could never have been initiated by legislation applicable equally to all parts of the country. Among such experiments and improvements we may mention the teaching of mechanical skill („sloyd“) for boys, of housekeeping for girls, supplementary schools for backward children, as well as sanitary regulations, and medical control over all the pupils of the Elementary School.

When, therefore, the outward organisation of the Elementary Schools shows various prominent differences, yet some larger features are common to them all.

In all these schools the teaching is exclusively entrusted to teachers educated for their profession on strictly methodical lines, and certificated by the State. All these teachers, apart from comparatively young probationary masters, hold permanent positions for life. They all have a right to a fixed salary, to superannuation, and to provision for their families after their death. This security of position produces a class of teachers technically trained for their profession, tested in their knowledge and in their conduct of life, among whom sound pedagogical traditions can be handed on, new experiences can be gathered, and definite methods of teaching and education can be formed. The abundance of pedagogical periodical literature and books, the numerous scientific associations, the active participation of the teachers in the courses and series of lectures arranged for them by the local authorities, all this proves that the teachers are penetrated, not only by an *esprit de corps* that deserves recognition, but also by a most active striving after mental improvement.

Another important feature of the German school system is the enforcement of compulsory education. All children, mentally and bodily capable of instruction, are required to attend an elementary school, the age of entrance differing slightly in the various German States. Excepted are only those children that can be proved to receive equivalent private instruction, or that attend higher-class schools.

The number of those who, in spite of these regulations, still manage to evade teaching, is a comparatively very small one. They are found chiefly in the families of strolling actors, acrobats, and the shifting population engaged in river navigation. In 1895, of the 5,317,037 children on the registers, in 36,138 Prussian public elementary schools, only 487 evaded attendance. In 1901, this number, among 5,754,728 children on the registers, in 36,756 schools, had risen to 548.

The compulsory attendance applies not only to the entrance of the children into the schools, but also to their continuance in them up to a certain age. In the same manner as entrance may be deferred in the case of illness or weak constitution of the children, especially where the distances to the school are considerable, so also, under certain circumstances, and with the sanction of the authorities, the children may be dispensed from attendance up to the end of the course of instruction. Negligent parents or their representatives are liable to punishment by fines, or even by imprisonment. In the year 1901, among the children of school age, 10,672 were unable to attend on account of mental or bodily defects; 16,109 could not be received immediately after the completion of their sixth year; 53,794 were dispensed from attendance before the end of their fourteenth year.

Not only entrance into the schools and completion of the course are enforced, but also regularity of attendance during the latter. Infringements in this respect are likewise punished in the manner mentioned above.

So as not to render compliance with the law impossible, care is taken to provide the necessary school buildings within reasonable distance from the homes of the pupils. Scarcity of school buildings may specially occur in newly rising towns, where, not infrequently, the erection of schools cannot always keep pace with the increase of population caused by the establishment of new branches of industry. Long distances between school and home are a misfortune occurring

especially in sparsely populated districts. While, according to the latest Prussian statistics, of 1901, the number of children that had to be excluded from attendance on account of overcrowding of the schools, amounted to only 2735 (in 1891 to 3239); 214289 children, of whom 190159 in country districts, had to go a distance from the school of more than  $2\frac{1}{2}$  km. (about  $1\frac{1}{2}$  Engl. miles).

The demands made by the Elementary School on the bodily and mental capabilities both of pupils and teachers, are generally severe ones in Germany. The number of yearly school-days is here perhaps higher than in any other civilised country. The week has six working-days, and the number of weekly hours, at least in the upper classes, not infrequently amounts to more than thirty. The holidays, with differences in the time of occurrence and extent in the various States and districts, amount altogether to at most twelve weeks, thus leaving, when a few occasional holidays are deducted, a total of about 230 to 240 yearly working days. The holidays coincide with the great church festivals, Christmas, Easter, and Whitsuntide, and usually form, besides, two special groups, in summer and in winter.

The aims of the teaching, prescribed in the curricula of the elementary schools, require, for their realisation, the full time of the compulsory age and the regular attendance of the pupils. But they also presuppose diligence, conscientious performance of duty, and earnestness on the part both of teachers and scholars. Those pupils, however, who fail in these respects, are corrected by rigorous discipline.

It is hardly ever possible to present the results of the school teaching in an exact statistical form. Nor can it usually be definitely shown what part in the forming of the pupils character and in his later success in life is attributable to his natural disposition, to home training, or to the influence of the school. Yet a comparatively satisfactory standard, by which the activity of the elementary school may be gauged is afforded by the spread of the simplest elements of school education, reading and writing, among the grown-up population of a country. For a considerable number of years, those liable to military service in Germany have been tested as to their school training. The results of the latest of these tests, for the year 1901, in the German Empire, are presented in the following Table, showing a gratifying advance in this respect, as compared with those of the years 1881 and 1891. These figures

afford eloquent testimony to the fact that the educational labours of the German teachers have not been without results.

**Place of Extraction<sup>1)</sup> and Schooling of the Recruits<sup>2)</sup> incorporated in the Year 1901.**

1) By Place of Extraction is here understood, in general the birth-place, which is verified, throughout, for the army corps belonging to the resort of the Prussian Ministry of War (divisions of the Guards, 1st 11th 14th 18th army corps inclusive of the Hessian division), for the 13th (Württemberg) army corps, and for the navy, and, as a rule, is stated at least for the 12th and 19th (1st and 2nd Saxon) army corps. For the three Bavarian army corps, on the other hand, the place of residence at the time of school attendance is verified. — 2) By incorporated recruits are here understood both those of the levies and those who have voluntarily entered the army or the navy for a two, three, or four year's service, or also into the navy for a five or six years' service, but not the one year's volunteers. — 3) Among these 23; 4) 48; 5) 34 with schooling in a foreign language; to the remaining parts of the Empire belong 23 of such. — 6) Besides 116; 7) 32; 8) 7 from foreign countries, among whom without schooling 1901:2, 1891:1.

The foreigner who hears of the enormous sums which the German Empire expends every year on the maintenance and increase of its army and fleet, may easily fall into the mistake of assuming that this outlay, imposed by the history and the geographical position of the country, leaves the German nation only few means for the promotion of ideal interests. There may be an appearance of justification for such an assumption, when merely the proportion is considered, that exists between the State expenditure for the army and for the schools. But nevertheless, the sums devoted in Germany, by the State and by the communities, to elementary education, is not inconsiderable. The total outlay for this purpose in the German Empire (with the exception of the Grand Duchy of Mecklenburg-Schwerin, for which no information was available), in the year 1901, amounted to 412 886 000 M., of which 120 357 000 M. were derived from State contributions.

These figures of 1901 represent the last ascertainable stage in a constantly progressive development, and will probably be considerably exceeded at the present time. And when, in the absence of uniform imperial statistics of the educational system, already referred to, this progression cannot be verified equally for all the States, the following survey may, at least, give some evidence of the permanent advance in the system of Prussian elementary education.

### German Empire.

#### Public Elementary Schools 1891/2 and 1900/1.

	1891/2	1900/1
1. Public Elem. Schools . . . . .	56 563	58 164
2. Fully occupied teachers (male and female) . . . . .	120 032	144 484*)
3. Pupils of Elem. Schools . . . . .	7 925 688	8 829 812
4. Expenditure for Elem. Schools . . . M.	242 399 000	412 886 000
5. State Contributions . . . . . „	69 310 000	120 357 000
6. Number of:		
a) Inhabitants to each Elem. School . . . . .	874	969
b) Pupils to every 100 inhabitants	16,03	15,66
c) Pupils to each fully occupied teacher . . . . .	66	61

\*) Among these 22 339 female teachers.

d) Cost of school maintenance for each pupil . . . . . M.	1891/2	1900/1
	31	47
e) State contribution for each pupil . . . . .	8,75	13,63
f) Cost of school maintenance of each Elem. School . . . . . „	4 285	7 159
g) State contribution for each Elem. School . . . . . „	1 225	2 075

The teachers are duly certificated, appointed permanently, or with prospect of permanency, entitled to pension, and dismissible only by judicial disciplinary decision.

The items under 4 and 5 are minimum amounts; the costs of the general administration and inspection of the schools, and of the training of the teachers, are not included. The items under 4 are comprise also those under 5.

1901		82 692	20 929
		1891 :	81 810
		1901 :	103 621

		Male	Female
II. Assistants, not fully employed . . . . .	1891	7 054	1 101
	1901	3 570	1 459
III. Female Teachers of Needlework . . . . .	1891	—	39 735
	1902	—	33 351

The decline in the number of teachers of needlework is explained by the fact that instruction in this is imparted, more and more generally, by fully occupied technical female teachers.

The healthy development of the system of Elementary education, shown by the preceding figures, the constantly increasing number of the children under tuition, the growing number, in a larger proportion, of classes, class-rooms, and teachers, the decrease of inferior forms of schools, as compared with the more highly organised school systems with more numerous classes, the considerable accession of schools with seven and eight classes, and of pupils taught in them, the constantly higher outlay for salaries of teachers, the rise in their average available number, and finally the continual growth of total expenditure for Elementary education, all this entitles the nation to look back with satisfaction on what has hitherto been accomplished.

## 2. Time-tables of Elementary Schools.

The subjects of instruction, with their distribution, in the German Elementary Schools, will be sufficiently shown by the following time-tables of various Schools, exhibited by way of examples.

### Prussia.

Elementary School with Six Divisions in Danzig. (Boys and Girls.)

1) For Mecklenburg-Schwerin no information is available.

## 4. Intermediate Elementary Schools.

The term Intermediate Schools (Mittelschulen) indicates, in Prussia and a few other North German States, a kind of school the aims of which reach beyond those of the Elementary school, thus occupying an intermediate position between the latter and the Secondary schools (Realschule, Gymnasium). In the Kingdom of Saxony there are similar establishments under the name of Intermediate, or also Higher Elementary Schools. Hamburg has a

number of schools with special higher classes beyond the aim of the elementary schools; these classes are called „selecta“. Among the South German States, Baden (in the so-called advanced divisions) and Hesse (in the expanded Elementary Schools of some towns) possess kindred establishments.

According to the statistical enquiry of December the 1st 1899, in the Kingdom of Saxony, the number of intermediate Elementary Schools was 241, with 4859 classes, and 188 366 pupils, and that of the higher Elementary schools 45, with 616 classes, and 17 460 pupils.

In the year 1900, in the Grand Duchy of Baden, the advanced divisions (the statistics do not show in how many schools), with 2598 boys and 3864 girls, were taught by 140 male and 66 female teachers.

In the Grand Duchy of Hesse there were in the spring of 1902, in four towns, 6 expanded Elementary schools, with 88 classes and 3695 pupils (1784 boys and 1911 girls), who received instruction from 72 male and 18 female teachers.

In Prussia schools of this kind already existed of old in the most various forms and under the most various denominations. Their curriculum was usually distinguished only by the fact that instruction in a foreign language was imparted, mostly Latin in the boys' schools, French in the girls' schools. Often the distinction consisted merely in the different amounts of school-fees. All these schools received, in October 1872, a uniform organisation, with the following curriculum.

Subjects of Instruction	Number of weekly Hours					
	I.	II.	III.	IV.	V.	VI.
Religion . . . . .	2	2	2	3	3	3
German, incl. Reading and Writing .	4	6	8	12	12	12
Arithmetic . . . . .	3	3	3	5	5	5
Elements of Geometry . . . . .	3	2	2	—	—	—
Natural Science . . . . .	2	2	2	—	—	—
Physics (Chemistry) . . . . .	3	2	—	—	—	—
Geography . . . . .	2	2	2	2	—	—
History . . . . .	2	2	2	—	—	—
French . . . . .	5	5	5	—	—	—
Drawing . . . . .	2	2	2	2	—	—
Singing . . . . .	2	2	2	2	2	2
Gymnastics . . . . .	2	2	2	2	2	2
Total	32	32	32	28	24	24

This time-table, however, can be modified and also extended, according to local needs. In particular, French can be replaced by English. Arithmetic includes also the elements of Algebra. Most of the intermediate schools have now 8 or 9 classes. In their lower classes they merely represent the elementary School. As a specimen of the time-tables of the intermediate schools, that of the one for boys in Stettin may still be exhibited here.

Total . . . . .	32	32	32	32	32	28	26	21	20

On the 27th of June 1901 there were in Prussia 456 public intermediate schools, with 3759 school-classes, and 134 741 pupils, who were taught by 3571 male and 1192 female, together 4763 teachers.

According to confessions, these Schools are classified into 284 Protestant, 54 Roman Catholic, 59 common to both denominations, and 59 undenominational ones.

Of the pupils 117 853 were Protestants, 13 314 Roman Catholics, 393 of other Christian denominations, and 3171 Jews.

Of the Scientific teachers

3621, i. e. 2896 men and 725 women were of the Protestant

526, „ 442 „ „ 84 „ „ „ „ Roman Catholic

1, was of another Christian denomination,

and 35, i. e. 27 men and 8 women were of the Jewish persuasion.

No statistics are available for this question in the case of the technica teachers.

Of the schools 452 are supported by the communities, 2 by the State, and 2 by endowments.

As independent educational establishments, there were 413 schools with 130 971 pupils; connected with an elementary school, 43 schools with 3770 pupils.

### 5. Education of the Blind and Deaf-Mute.

The institutions for the blind and deaf-mute have on the one hand the character of schools, on the other that of provident and charitable institutions.

Already in the 18th century, Chr. Niesen, who died in 1785, invented, in Germany, several appropriate appliances for teaching the blind, which became known also to Valentin Haüy, a Frenchman, who was the first to found, in 1785, a school for the blind in Paris. In 1806 Haüy came also to Berlin, and soon after, on his initiative, such an institution was established there, namely at the expense of the government.

During the wars of the following years many soldiers became blind, in consequence of a contagious inflammation of the eyes, and hence several military institutions for the blind were established, which were to be kept up only until these unfortunate people should have acquired sufficient training in appropriate handicrafts. From one of these so-called „Werkschulen“, or schools for mechanics, arose in 1818 the still existing Silesian Institution for the Blind in Breslau. During the following decades the number of institutions for the blind continually increased, both in Prussia and in the other Federal States, and their present position is shown in the following table.

States	Number of Institutions	Number of Inmates	Number of Teachers	Blind Assistant Masters	Teachers of Handicrafts and Assistants
Prussia . . . . .	20	2085	91	29	67
Bavaria . . . . .	5	374	17	12	15
Saxony . . . . .	4	269	17	3	11
Württemberg . . . . .	3	179	8	2	7
Other States . . . . .	10	565	32	8	23
Total . . . . .	42	3472	165	54	123

Of the total number of inmates 2438 are pupils, 1034 patients. The institutions are supported, partly by the State, partly by provinces and public bodies, partly by endowments.

Both sexes are received, but they use the same day-rooms and play-grounds only till their tenth year at most, when a separation takes place. The number of the male pupils is usually double that of the female ones, as blind girls are kept more at home by the

parents, and as their education is considered of less importance than that of the boys.

The teaching of the deaf-mute, after various isolated attempts, was systematically developed about the same time in France, by the abbé de l'Épée, and in Germany, by Samuel Heinicke. But whereas the French method was based on the language of signs, Heinicke made the attempt to teach the deaf and dumb actual speaking, in which he was successful. In the year 1878 Heinicke opened in Leipzig the first German public institution for the

Deaf-Mute Statistics for the German Empire, according to the Census of December the 1st 1900.

1) To every 10 000 Inhabitants there are 8.7 Deaf and Dumb.

deaf and dumb, and the number of such gradually increased. In Prussia the first one was founded in Berlin, as a private institution, by Dr. Eschke, in 1788, and from it arose, in 1798, the Royal Institution for the Deaf and Dumb.

At present there are in Prussia 45, in Bavaria 13, in Saxony 3, in Württemberg 8, and in the whole Empire 90 institutions for the deaf and dumb.

Of these institutions 25 are supported by the State, 42 by provinces or districts, 4 by towns, and 19 by private societies, which, as a rule, are assisted by contributions from the public funds. Among the institutions 38 are boarding establishments, 44 day-schools, while 11 have both boarders and day-scholars. The total number of inmates, in 682 classes, is 6703, of whom 3674 are boys and 3029 girls; 4056 are Protestants, 2553 Roman Catholics, and 94 Jews. The number of male teachers is 651, that of the female teachers 104, total 755.

The children are received, as a rule, in their seventh year. In the larger German States the education of the deaf and dumb is not compulsory, in Prussia it is so only in the province of Schleswig-Holstein. The course of instruction, in most of the institutions, extends over eight years. The oral system forms the central part of the instruction, but the practice of understanding speakers by watching the movements of their lips is considered of equal importance. For the rest the teaching corresponds to that of the elementary schools.

---

## V. TRAINING COLLEGES FOR ELEMENTARY TEACHERS.

The elementary teachers receive their professional education in preparatory institutions and seminaries. In some States there are only seminaries without separate preparatory schools, but in such the seminary course lasts all the longer, as a rule six years. In Prussia both the preparatory institutions and the seminaries have three classes with a one year's course each, and the curriculum of the two establishments has been uniformly regulated as an organic whole. The pupils entering the preparatory institutions must have passed the prescribed time in the elementary school, that is to say, must have reached the age of fourteen. But instead of the elementary school,

many have attended intermediate schools, or the lower classes of higher institutions. The curriculum of the Prussian preparatory training-schools, according to the regulations of July the 1st 1901, has the foregoing division of weekly hours.

Music is taught, partly in the classes, partly in special divisions, in 4 to 6 weekly hours. It embraces theory of music, singing, playing on the violin, piano, and organ. In the seminary piano playing is reserved for private practice.

In the preparatory training-schools final examinations, written and oral, take place, the passing of which bestows the right of entering a seminary. Any one wishing to be admitted to a seminary without having attended a preparatory training-school, must submit to a special examination.

The seminary training concludes with the first teacher's examination, likewise a written and oral one. For most of the candidates that have completed the course of the seminary, some subjects of examination are added. After passing this examination, the candidates can be employed as assistant masters.

The qualification for definite appointment (with the right of superannuation) they obtain only by passing the second teacher's examination, one of a practical-pedagogical character, for which they can present themselves when they have been employed in a Prussian School for at least two, and at most five, years.

The qualification for appointment as teacher in intermediate schools and higher girls' schools is acquired by the passing of the special examination for teachers in intermediate schools. Only those elementary teachers are admitted to it, who have passed the second examination, mentioned above, and besides also theological students and those who are preparing for the secondary schools. When the latter have acquired the qualification for the secondary schools, they can be appointed, without further preliminaries, to intermediate schools and higher girls' schools.

Finally there is still a special examination for rectors or headmasters, to be passed by those who desire to be appointed as seminary directors, seminary teachers, principals of public preparatory training-colleges, as district school inspectors, as heads of higher girls' schools, intermediate schools, and elementary schools with six and additional higher classes. The examination is a written and oral one, with pedagogy and practice and methods of teaching as principal subjects.

S stands for Seminaries, P for Preparatory institutions.

The number of Seminaries for female teachers is so small because most of these seminaries are not State, but municipal or private, Institutions.

1) Besides 20 Jewesses. Also in the other Federal States are found Jewish, altogether 70, scholars.

## VI. TECHNICAL HIGH SCHOOLS.

### 1. Historical Outline.

The technical higher institutions of Germany are a product of the 19th century. Starting from small beginnings, together with the development of the technical arts, they have attained their present important position as places of instruction and research, that embrace the manifold fields of technical arts with the sciences on which they are based, and by which they are completed. The mutual connection between the technical and the natural sciences, and the relation of these schools to the great questions of national industry, naturally entail a continued development of their design, curriculum, and method, and call for further enlargement and extension of their aims.

Before the technical higher schools could be properly developed, preparatory institutions had to be created and extended. The organisation of Realschulen, which were in the first place to serve the spread of „generally useful knowledge“, was followed by the establishment of schools for distinct and special branches of science. The aim of such technical institutions, established at the beginning of the 19th century, was the training both of craftsmen and mechanics, and of engineers. Specialists saw plainly that the preparatory theoretical schooling of the latter had to be a more comprehensive and deeper one than that of the former. But as long as a school was to complete the training in a course of two or three years, while in the case of craftsmen and mechanics the pupils were admitted at a very youthful age (in the Berlin industrial school, e. g. at their 12th year), either the teaching was necessarily too difficult for a large portion of the pupils, or the general standard of instruction

had to be unduly lowered. Hence the training during the first year or years frequently assumed the character of that in a preparatory school. A further difficulty was found in the fact that, for architects, instruction in the purely artistic parts of their work goes hand in hand with that in the technical ones, the latter of which more particularly concerns the civil engineer, whereas the former points to the academy of the fine arts.

As early as 1799 an Academy of Architecture had been established in Berlin. The aim of the institution was „the theoretical and practical training of skilful land-surveyors, civil and hydraulic engineers, also of building artisans, especially for the royal States, to which training also foreigners are admitted, in so far as this can be done without prejudice to native pupils“. Technology and chemistry, therefore, were not taught at all, while machine construction and likewise higher mathematics occupied a subordinate position; generally speaking, the school was intended for officials of public works (without any distinction between architects and engineers). Not till 1821, by the side of this institution, arose the Industrial Academy, in which special attention was devoted to the study of chemistry, technology, and machine construction. It is true, that precisely for this school, especially at first, the required preparatory schooling, in accordance with the age of entrance of the pupils, that of 12 years, was a very slight one, indeed merely writing and the first four rules of arithmetic. Soon these two Berlin academies entered into a closer connection, temporarily by one person being director of both, and developed under favourable circumstances, although, for a time, the artistic part of the architectural teaching branched off from the industrial Academy, and was transferred to the Academy of the Plastic Arts.

In the third decade of the century, also other German States had started the foundation of higher technical schools. In Dresden a „technical educational institution“ was established in 1828, the aims of which, it is true, were no very high ones at first. As characteristic of the position of such institutions at that time, we may point to a provision according to which the technical scholars educated in them should be freed from the limitations otherwise imposed on mechanics and craftsmen by the various guilds.

In Munich, after plans had been considered, in 1823, for „a higher school that should embrace all technical studies“, a „polytechnic central school“ was founded there, in 1827, which was broken up, in

1833, into three „polytechnic schools“, into one for Munich, one for Augsburg, and another for Nürnberg.

From about the same time dates the establishment of the Industrial Schools in Stuttgart (1829—1832) and Darmstadt (1836), the latter of which had been preceded, in 1826, by the foundation of a Real-schule with technical instruction. The Industrial School in Zürich was opened in 1832. To the year 1835 belongs the reorganisation of the Collegium Carolinum in Brunswick, by which the technical teaching of the institution was materially extended and transformed.

In 1831, the „higher Industrial School“ in Hanover received a new organisation.

But of the greatest importance for the following decades was the institution that arose in Karlsruhe. Here the already existing engineering school, the school of architecture, and a private industrial school in Freiburg were joined together into a Polytechnic School, in 1825, the first one in Germany. A preparatory school led to the courses of a mercantile and of a technical division; the real higher instruction for engineers and architects was still separate from these, and was given in special courses under the engineering department and in the above mentioned school of architecture. By the reorganisation of 1832 these were incorporated in the Polytechnic School. In addition to the preparatory school, the student had to pass through a course of four or five years, during which theoretical and practical subjects were taught to a larger extent than anywhere else. Down to the present time, the essential principles of the reorganisation referred to retain their full validity. The management of the institution is characterised by a periodic change of director, who is chosen annually from among the older teachers; likewise by the participation of the closer and wider teachers' conference in the organisation and educational concerns of the School. The economic concerns also are subject to a managing council composed of the teachers of the institution.

The position which the Polytechnic School in Karlsruhe had occupied during the fourth decade, it also maintained during the next. To a large extent this was owing to the activity of Redtenbacher, who, an Austrian by birth, had been called in 1841 from Zürich to Karlsruhe. Here, especially after the separation of the courses into a chemical-technical and a mechanical-technical one, he found an opportunity for developing his full strength in the teaching and

thorough treatment of the theory of mechanical engineering and machine construction.

About the year 1850, the inner reorganisation of the high schools showed itself outwardly in many ways; schools were thus reorganised as „polytechnic schools“ in Hanover in 1847, in Dresden in 1851 (preceded by that of Stuttgart in 1840, followed by that of Brunswick in 1862). Of equal importance were the new regulations for the Architectural Academy and the Industrial Institute in Berlin, in the years 1849 and 1850. About the same time the appointment of privat-docents was introduced into some of the technical institutions of Germany and Austria, and simultaneously the principle of liberty of teaching and learning was established to a larger extent.

In the year 1868 the „Polytechnikum“ (or Polytechnic High School), with its academical organisation, was opened in Munich, and was to take the place of the old Polytechnic School. The Darmstadt Technical School, which had been a higher industrial school till 1864, was reorganised as a Polytechnic Institution in 1869. The Technical High School in Aachen was opened in 1870, while in the following year the same qualification was bestowed on the Dresden „Polytechnikum“, which was removed in 1875 to new and suitable buildings.

Between 1875 and 1880 the Polytechnic School in Hanover was reconstituted as a High School, the Stuttgart one in 1876.

The Polytechnic School in Brunswick, reorganised in 1872 as a „technical high school“, was quartered in its new home in 1877. By the combination of the Berlin Architectural and Industrial Academy, in 1879, into a Technical High School, and by its removal to the new building in Charlottenburg (1884), its outward development was completed.

Important for this last period of the transformation of various institutions into High Schools, which we may date from about 1870, is the closer connection of the nine Schools among themselves. This connection resulted in the furtherance of the students' liberty in selecting their schools, by giving them credit in one institution for the time of study passed in another, and by the mutual validity of the examinations in each school. Especially in more recent times, the equivalent value of these examinations extends also to those for certificated engineer, while, at least partly, they rank with the State examinations. Appointments of teachers from one school to another

promote a closer bond of similar aims and labours, while the joint interests are materially furthered by meetings of representatives of the various schools, at which questions of importance to all are fully discussed.

---

## 2. Questions connected with the Subjects of Instruction.

More than in the various faculties of the University, the separate branches of instruction in the Technical High Schools act and react upon one another, thus necessitating a strictly systematic building-up of the course of instruction as a whole.

The various departments of Mathematical Science form the foundation of the whole structure.

From the very beginning, Physics and Chemistry have been in the closest connection with technical teaching.

Electro-technology stands in a most intimate relation to physical research, and owes its existence to the latter. Ohm's laws for electric currents, those of Faraday for the action of induction, Joule's law for the consumption of electric energy, formed the foundations of the grand modern applications of electricity to technical operations. The consequences of Maxwell's theory, and the experiments of Herz occasioned by it, led to the methods of wireless telegraphy, the importance of which cannot be finally estimated as yet. But electro-technology has also reacted on and promoted physical research. Not only do the physical laboratories, to which moreover have been added others for technical physics, operate with very different powers, but also conceptions have been variously adapted to the promotion of practical questions.

Probably from the beginning, chemical research, as also in the case of University teaching, stood in the closest relation to practical purposes. Nevertheless, in this subject also, the technical High School will make those departments its special business, that are connected with technical operations on a large scale, and at the present time, in addition to the chemistry of dyes, inorganic chemistry, metallurgy, and most specially, as a branch of electro-technology, electro-chemistry, are acquiring a continually growing importance.

With respect to the constructive problems of the technical sciences, we may probably ascribe to the activity of the High

Schools, in teaching and in research, the creation of the theoretical foundations for their systematic solution. For the representative of technical subjects in the High School a difficulty, not to be underestimated, is found in the necessity of keeping pace with the practical achievements of technical science, which are, besides, mostly kept from publicity. Hence, teaching, research, and direct practical activity are all to be combined. Such a combination has shown itself most successful in the case of architecture, the teacher of which is usually active also as a practical builder, and, when commissioned by State or municipality, is not infrequently enabled to prove his capacity by the erection of monumental works.

Two other important points in the more recent development of technical instruction must be referred to.

In the first place, the evolution of laboratory teaching. In the founding of mechanical-technical laboratories, the first aim was pure research, especially with reference to the theory of solidity, and the necessity of creating a practical basis for testing building materials as to their technical applicability. But soon it was found useful to make these laboratories accessible also to students, first for presenting single experiments, then also for independent work. Another not unimportant task was imposed on these laboratories, when they began to serve as examining institutions recognised by the state, and to undertake further functions in other technical departments. Soon the rise of electro-technology led to a general establishment of electro-technical, and further of electro-chemical, laboratories, in addition to the existing physical and chemical ones, thus producing in the teaching an extensive application of physical methods of measurement. At the same time, the importance of carrying out practical experiments and measurements in motors and manufacturing machines showed itself more and more. Thus, especially when also single Universities, particularly Göttingen, proceeded to labour in the department of „Macrophysics“, by extending their laboratories, the great activity of recent years has resulted in a thorough re-modification of the teaching of engineering, with reference to the practical work of the laboratory. On the other hand, and simultaneously, a not inconsiderable narrowing of the purely theoretical subjects took place, especially of the preparatory ones, as well as a closer connection between the constructive and the theoretical departments of mechanical engineering, and probably also a retrogression in elaborating great projects and programmes in the teaching, in favour

of a careful and thorough treatment of detailed constructions. To promote the latter, must particularly be the aim and limit of the tasks of the High School in connection with the final examination for the diploma, either by prescribing a longer piece of work for exact arithmetical and constructive treatment, or a number of shorter ones based on accurate detailed specifications.

In the second place, with the increasing importance of technical science to modern life, with the great material value attached to it, and with the ever more powerful social organisation of modern industry, the problems of political economy, the social and judicial ones obtain a continually greater prominence, so that the exhaustive study of this subject necessarily becomes more and more essential.

One difficulty, it is true, will make itself more and more felt in the development and perfection of the teaching. With the abundance and importance of the subject-matter of instruction, it is possible to overtake it, in the present four years' High School course, only by constant compression in each single department, by summary treatment of many branches, and by omission of whatever does not directly serve the special purpose. Hence, an extension of the time of study seems required, unless still further restrictions be introduced in particular subjects, which could not be faced without serious drawbacks. To some extent, it is true, simplification and facilitation might be attained by a part of the necessary preparatory teaching being included in the curricula of all secondary schools. In that case, optionally perhaps, technical drawing and descriptive geometry should be introduced also into the Gymnasias, and likewise, generally, the first elements of higher mathematics. This, together with the shortening of the existing nine years' course of the secondary school, seem to be the only possible solution, unless a young man's entrance into practical life be still further delayed than it is even at present.

The very fact that the existing four years' course can be devoted only to the preparatory theoretic training for the subject, and that the technical High School alone is unable to produce finished engineers, leads to another question that should not be passed over in this connection, viz., the practical training for the technical profession.

As long as the technical schools simultaneously undertook the training of lower-class technicians, and schools for this purpose were connected with them, the pupils used to enter the school, as a rule,

only by first passing through a practical apprenticeship, while at the same time the previously acquired knowledge that was demanded was a modest one. Frequently also the school itself offered practical courses in workroom operations. But the gradually increased demands for previously acquired general culture, have led more and more to the attempt of introducing the pupil into the High School straight from the intermediate school, and without passing through a practical apprenticeship. Indeed, it is in the interest of a steady development in a theoretical direction, when no interruption takes place here. On the other hand, the teaching of the constructive subjects, especially in mechanical engineering and in architecture, will produce a really more vivid impression, when preceded by a practical training. Here also, it is true, the individuality of the pupil has to be considered, but, upon the whole, it will not appear unfair, when in any case the course of study is looked upon as completed only after a term of practical apprenticeship.

Four years ago, the Association of German Engineers energetically advocated this condition, and many among the larger employers have supported it by facilitating the young man's reception as apprentice. In the new regulations of examination, this demand is enforced, if not as a condition for admission to the examination, at any rate as one for bestowing the title of certificated engineer. Of course, in that case, an understanding will have to be come to, to make the practical training in factory operations as instructive as possible to the young student, and to devote to it special attention. This is a thankful, but indeed also a responsible task for the directors and the engineers of the establishments; for, in addition to a detailed instruction in all technical questions, special stress will have to be laid on practical management and social questions.

In conclusion, another important point must be touched upon, the question of the training of teachers, especially of those of mathematics and natural science, and with reference to the particular requirements of the technical institutions. For the latter this constitutes a wide field of action. Especially in mathematics, the teacher will be able to utilise directly, in the secondary school, only a comparatively small part of his knowledge acquired at the University. But for him the training is essential in three points, with reference to the whole method of his subsequent teaching, namely, in the exact foundation and development of primary notions, in the mastery of the inner connection of the various disciplines, and lastly in the extension of the

applications of his subject to physical problems, which indeed have frequently led to the formation of mathematical methods. For one who intends to devote himself to research work, there would be nothing unnatural in his preference for any particular subject, according to his individual talents; but for a teacher such a preference would be out of place. And when, naturally, the teaching in the Technical High Schools, even in the general lectures, presents theoretical explanations in a more tangible form, and enlivens them by practical applications; when further, in special lectures, it passes on to technical problems, when here technical mechanics and technical physics, as well as geodesy can be drawn into the curriculum, then all this, as supplementing the University instruction with its usually more abstract tendency, will be of the greatest benefit to the future teacher of mathematics and physics, wherever he may afterwards be active in his profession. But for the future teacher of the technical school such an widening of his knowledge becomes a necessity, if he desires to be in touch with the essential interests of his hearers, and able to participate actively in the important problems presented, in various forms, by technical science also to theoretical investigations.

The mutual relation thus formed between University and Technical High School, has the closest connection with a question frequently discussed in more recent times, namely that of a combination of both institutions into a greater University embracing all branches of learning. And it may well be said that the relation referred to is by no means the most important one. We have endeavoured to show the close connection of mathematics and the whole of the natural sciences with technical science, and we have pointed out how important for the technical scholar has become a training in questions of national and political economy and of law. On the other hand, an insight into technical science will become ever more essential to those engaged in natural science, law, and economics. Nowadays, in the Universities also, a continually growing importance is attached to practical and laboratory work, so that the outward form of instruction in the two establishments does not show any essential differences. Inner reasons, therefore, would seem to plead for such a combination, but although many a voice has been raised in favour of it, yet, at the present time, it no longer appears to be practicable.

After the failure of previous attempts to transfer to the University the training of technical State officials, owing to the slight

estimation in which technical work was held, and to an imperfect appreciation of technical matters in general, the technical High Schools have developed independently and steadily on lines of their own, and thus forced their way to a recognition of their importance and of their earnestness in pursuing their functions. Nowadays they form a widely organised whole, for which the framework of one faculty, or of two — such would be their position in the Universities — has become too narrow. The transference of their general department to the philosophical faculty of the University, would mean only a juxtaposition, not an amalgamation, for the mathematical-physical subjects would still require a twofold representation, and, as was pointed out above, would still have to take account of a twofold aim. The whole, however, would be too large a body, for which, with the multitude, the variety, and the rivalry of interests of the constituent members, a uniform organic co-operation would no longer be possible. For even at the present time, the extent and the number of the subjects belonging to the single faculties are already so dissimilar, that in reality only the bond of historical development holds them together.

No doubt, for the development of the Technical High School, the competition with the University was, in various ways, of the greatest importance. To the example of the latter it owes its insight into the necessity for free teaching and free research, which have gradually led to its present organisation. On the other hand, on many questions of University teaching, especially on the relative value of lecture and practical exercise, on the development of laboratory instruction, on the widening of the interests in the direction of applied problems, the Technical High School has not been without its influence. Yet all this would not suffice to make the mutual relation so close as to allow the Technical High Schools to be organically incorporated with the Universities. But to an increasing extent, in places where both kinds of institutions are found represented, a mutual connection will and should be formed, to the advantage both of teachers and of taught.

In conclusion, we may quote the words with which the Emperor William (on the occasion of the Charlottenburg celebration), with far-reaching foresight, indicated this connection between, and the aims and tasks that lie before, the two establishments:

„In the relation of the Technical High Schools to the other highest educational establishments, there is no opposition of interests,

and no other competition than this, that each of them, and every member of them for his own part, should do full justice to the claims of life and science, mindful of the words of Goethe:

Neither be like to the other, but each be like to the highest!  
How is this to be done? Let each be complete in himself!

If the Technical High Schools, that have attained to so flourishing a condition in the century now nearly past, remain faithful to this admonition, the coming age will find them well equipped also to do full justice to the problems, of which the progressive development of the world's civilisation expects, in an increasing measure, the solution from technical science."

### 3. General Organisation of the Technical High Schools.

#### 1. Organisation of the Teaching.

The whole of the Technical High Schools of Germany deal with the four technical departments of training for architects, civil engineers, mechanical engineers, and technical chemists. Darmstadt and Karlsruhe have a special department for electro-technology, while in the other High Schools, except in Hanover, this subject is combined with mechanical engineering, in the latter town with the chemical-technical branch. Besides, as technical departments, Berlin has a special division for shipbuilding and for marine engine construction, Brunswick for pharmacy, Karlsruhe for forestry, Munich for agriculture.

In all the High Schools the mathematical-physical subjects, and those of general education, have been combined into a „General Department“, but in Stuttgart these form two separate branches.

The regular course of study in the separate departments has been laid down, in all the High Schools, with due regard to their interdependence, and to the necessity for keeping the aims of the various studies separate. Although these schemes are not actually prescribed, they nevertheless afford the students a sure guidance in conducting their studies in such a manner that, within a given time

(usually four years), they may be enabled to acquire the scientific training necessary for their profession. Indeed, with the close connection among the subjects of instruction, an adherence to a definite arrangement of the studies cannot be avoided, and can be considered as only a salutary restriction of the full liberty of study. The introduction of optional subjects, in supplementary lectures and practical exercises, will afford, in spite of the restrictive regulations of the general course of study, a proper guarantee for the training of each individual students.

The following table shows the average number of weekly hours devoted, during a semester, to lectures (L) and practical exercises (E) in the nine Technical High Schools.

Table of Average Number of Weekly Hours of Lectures and Exercises in the Technical High Schools, singly and jointly.

	Architects		Civil Engineers		Mechanical Engineers		Electrical Engineers	
	L.	E.	L.	E.	L.	E.	L.	E.
Aachen . . . . .	15	20	22	17	21	17	19	16
Berlin . . . . .	25	32	27	18	19	27	23	25
Brunswick . . . . .	13	33	16	18	16	21	14*	17
Darmstadt . . . . .	16	25	19	18	19	18	16	19
Dresden . . . . .	18	24	20	15	21	17	21	19
Hanover . . . . .	18	24	19	16	22	18	19	20
Karlsruhe . . . . .	21	27	21	16	22	16	20	15
Munich . . . . .	14	24	17	14	17	11	18	15
Stuttgart . . . . .	13*	29	15	16	19	16	18	16
Average for all the High Schools	17	26	20	17	20	18	19	19

The figures have been compiled from the time-tables of eight semesters, except those marked with,\* which cover 7 semesters.

The fees per semester and weekly hour range, for lectures, between 2,50 M. and 4 M., for exercises between 2 M. and 3 M. for ordinary students belonging to the Empire. In some High Schools the college-fees for foreigners are higher, in others the temporary hearers have to pay larger amounts, so that in those cases the rates rise to a maximum of 6 M. per hour for a lecture, of 5 M. for an exercise. Similar differences occur in the entrance-fees. They

amount to 10 and 30 M. for Germans of the Empire, to as much as 40 M. for foreigners. The fees for the practical work in the physical, chemical, mechanical-technical, and electro-technical laboratories are charged, in the majority of High Schools, according to a fixed rate.

Remission of fees can take place, as a rule, according to a ministerially fixed percentage of the total number of students (mostly 4 to 5%).

The college-fees as a whole (apart from the deductions caused, as in Munich, by remission or by share of bursaries), are paid out in only a few High Schools, in the same manner as in the Universities, to the respective teachers. In others the teacher receives only a part up to a fixed amount (maximum 1000 to 3000 M.), while a second part is equally divided among all the teachers, and finally a third part forms a source of income for the general purposes of the High School.

## 2. Teaching Staff.

The chief classes of teachers in the German Technical High Schools are the following:

1. Ordinary (salaried\*) Professors, who are permanently appointed to the chair of a special subject. In rank and average salary they are on the same level with the ordinary University professors. Their average salary (apart from allowance for house-rent) is about 5000 to 6500 M.

2. Extraordinary (salaried) Professors, who likewise hold a permanent appointment; their position corresponds to that of the similar professors in the University.

3. Other Teachers, in receipt of a remuneration (frequently, as individuals, with the title of Professor), who, chiefly employed in the High School, hold an appointment liable to reversal, for definite lectures or practical exercises, but without being entitled, like State officials, to a pension.

Besides there are Honorary Professors, Privatdocents, and Assistants, whose various functions need not be specified here.

---

\*) *Vide* Note in Chapt. on Universities, p. 6. (Note of the transl.).

A general view of the teaching power of the High Schools is presented in the following table.

Number of Teachers.

	Department of Architecture			Department of Civil Engineering			Departments of Mechanical Engineering, incl. those of Electro-Technology and (in Berlin that) of Shipbuilding		
	a	b	c	a	b	c	a	b	c
	Aachen . . . . .	7	2	3	7	—	5	9	1
Berlin . . . . .	20	17	41	14	8	38	26	9	97
Brunswick . . . . .	5	1	—	4	3	1	7	1	4
Darmstadt . . . . .	6	3	5	7	1	7	9	4	14
Dresden . . . . .	7	3	4	6	2	3	8	1	12
Hanover . . . . .	10	2	5	9	1	10	9	—	13
Karlsruhe . . . . .	8	8	4	6	2	3	11	3	18

Stuttgart . . . . .	5	2	3	8	—	5	10	5	9

	Chemical Department (incl. of the Agricultural Department in Munich)			General Department			Total			
	a	b	c	a	b	c	a	b	c	Total
Aachen . . . . .	10	5	14	7	5	2	40	13	32	85
Berlin . . . . .	14	17	26	16	16	31	90	67	233	390
Brunswick . . . . .	6	4	6	9	7	2	31	16	13	60
Darmstadt . . . . .	4	14	4	14	15	5	40	37	35	112
Dresden . . . . .	5	6	9	16	8	8	42	20	36	98
Hanover . . . . .	11	6	14	10	6	3	49	15	45	109
Karlsruhe . . . . .	11	15	16	9	9	3	45	37	44	126
Munich . . . . .	11	11	16	14	13	12	49	29	57	135
Stuttgart . . . . .	3	5	3	10	25	3	36	37	23	96

a) Salaried (ordinary and extraordinary) Professors; also unsalaried ones with teaching commission.

b) Unsalaried (extraordinary, honorary) Professors, without teaching commission, Privatdocents, and Teachers not on the regular staff.

c) Assistants in various departments.

### 3. Direction and Management.

For the direction and management of the Technical High Schools the following bodies exist:

1. Rector and Senate,
2. Boards of Departments,
3. Joint Board.

Besides, in the three Prussian High Schools, and in the Saxon one, there is a special managing official (for Berlin the syndic appointed by the Ministry of State, for Aachen and Hanover the President of the Provincial Government as commissioner, for Dresden a specially appointed ministerial official). The Government commissioner has in the first place the management of the economical affairs of the High School, and the chief direction of the pay-office. Moreover, in Prussia, he is entitled and obliged to examine communications between the Ministry and the High School, and as occasion offers, in budgetary and legal questions, to report on the latter.

The other High Schools are under the direct control of the respective ministries, and in economical matters the Rector reports directly to them.

The whole of the German High Schools possess the right of electing a Rector, or otherwise of proposing one, with confirmation by the reigning Sovereign or, in Prussia, by the Minister of Education. In Berlin, Darmstadt, Dresden, Karlsruhe, and Stuttgart the Rector is elected for one year, in Brunswick for two, in Aachen, Hanover, and Munich for three years. The Senate consists of the Rector as president, of his predecessor (here called Prorector), permanently of the heads of all the departmental staffs (with elective periods of one to three years), and besides, in some High Schools, of one or more specially elected members of the general staff.

Rector and Senate have to conduct the common affairs of the High School, and are charged with the general superintendence and discipline of the students.

The Rector represents both Senate and School externally, treats in their names with the authorities and with private persons, and conducts the whole of the correspondence.

The Boards of Departments are formed from the salaried, permanent (ordinary and extraordinary) Professors of the departments in question. The admission of other teachers is decided in each special case by the Ministry.

The chief duty of the Boards is to draw up the programmes and time-tables for the separate subjects, and to make the necessary proposals as to the general educational questions of the department, and specially with reference to the teaching appliances, and the appointment of the teachers required.

The most significant right of Senate and Boards is that of making proposals to the Ministry for the filling up of vacancies.

The Joint Board, consisting of all the members of the Departmental Boards (in Stuttgart only of the ordinary professors of the High School), is throughout entrusted with the election of a Rector.

But further, to this Board, in the single High Schools, is reserved the framing of final resolutions as to certain general matters concerning the High School, such as fixing the programmes of work drawn up by, the departments, settling the proposals for the financial estimates questions of discipline (*consilium abeundi*, etc.).

#### 4. Regulations for Admission.

The students of the Technical High Schools are divided into

- a) ordinary students,
- b) extraordinary students („Hospitanten“, i. e. regular hearers, and occasional hearers),
- c) persons allowed to share in the teaching received.

The admission of a German as an ordinary student is, on principle, dependent on the production of a leaving-certificate of a secondary school with nine classes, namely, of a German humanistic or Realgymnasium, or of a Higher Realschule, or of a Bavarian „School of Industry“ (i. e. a lower technical school), or also of the Saxon Industrial Academy at Chemnitz.

For the present, all the High Schools, with the exception of Dresden, Munich, and Stuttgart, which adhere strictly to the above regulations, also admit students when they have passed through seven of the nine classes of a secondary school.

In Darmstadt and Karlsruhe admission can also take place, at present, in virtue of a certificate of a Realschule with seven classes, as also when the pupil is ready to pass into the upper secunda of a secondary school with nine classes, or lastly when he possesses the leaving certificate of a Realschule with six classes, or also the authorisation for a one years' military service, but in the last two cases only with the addition of the certificate of a (governmental) technical secondary school with a two years' curriculum.

For Pharmacutists (Brunswick, Darmstadt, Stuttgart) and for Agriculturists (Munich), there are special terms of admission in accordance with those in the other High Schools.

Foreigners can, as a matter of principle, be admitted as students only when they have complied with the conditions fixed in their own countries for entrance at a University or at a Technical High School. In such cases the foreign certificate must be proved equivalent to one of the above mentioned German ones. In this respect, and in view of the very large number of foreigners (especially Russians) that seek admission at the various High Schools, the terms of entrance have frequently been rendered considerably more stringent, while for students from other German speaking countries (Austria, Switzerland) conditions prevail similar to those for subjects of the German Empire.

As extraordinary students („Hospitanten“, i. e. regular hearers, and occasional hearers) can be admitted, provided the interests of the teaching do not suffer thereby, those persons whose aim is a continuation of scientific or artistic education for a special professional purpose, but who have not fully complied with the conditions for admission as students. As a guarantee of general preparatory schooling, it is usual to accept the authorisation for a one year's military service, and proof of a sufficient scientific grounding in the subject in question.

Foreigners, in so far as they are at all admitted as extraordinary students, have to show that they possess, approximately, the same previous schooling.

To the teaching are admitted students of other High Schools (in Berlin and Munich), further, permission to attend can be obtained by persons (of riper age), who wish to participate in single lectures or practical exercises, but whose position in life prevents them from entering either as ordinary or as extraordinary students.

Such permission can also be granted to ladies, when in possession of the necessary previous schooling, and with the consent of the respective teachers.

## 5. Examinations, Academical Degrees and Dignities.

### *Examinations for Diplomas.*

Down to most recent times no uniform regulation existed for the examinations that form the completion of the studies in the Tech-

nical High Schools. In some of these the examinations qualified for the obtaining of diplomas, and their value was confined to the institution, while they were kept separate from the theoretical State examinations, qualifying for the various public technical appointments. In other High Schools, the first (theoretical) examinations for the Civil Service had been combined with the preliminary and the final examinations in the High School. It is true, the Federal States, interested in this question, had come to an understanding, by which the preliminary examination to be passed in the middle of the course should be of equivalent value for all, thus allowing the students, through the whole of their course, a free choice among all the German High Schools; but this understanding was again circumscribed by the closer regulations for the State examinations properly so called.

The right of bestowing the title of Certificated Engineer, after successful examination, was granted to the Technical High Schools of Prussia in the year 1899, on the occasion of the jubilee of the Charlottenburg High School. Subsequently this right was extended to all the other German Technical High Schools, and thus a fresh opportunity presented itself for making these examinations uniform and of equal value. At present the equalisation of the certificate examinations, if not actually effected, is about to be completed. The following is an outline of the new regulations for examinations, as they have been fixed in the official negotiations among the representatives of the Ministries of the various Federal States.

a) The Technical High Schools bestow the degree of Certificated Engineer in virtue of an examination, by which the candidate has to show that, by an academic-scientific study, he has acquired a sufficient foundation for independent professional activity in the subject chosen.

b) The diplomas can be obtained in thirteen different subjects, which need not be specified.

c) On the bestowal of the degree a diploma is presented, showing the result of the examination.

d) The diploma examination is divided into a preliminary and a principal examination.

e) The admission to examination is conditional at least on:

1. The producing of a leaving-certificate of a German secondary school with nine classes, of a Bavarian „School of Industry“ (i. e. a lower technical school), or of the Saxon Industrial Academy at Chemnitz.

Exceptions are allowed only in the case of foreign testimonials, when these appear to the authorities of equal value with the certificates just mentioned.

During the present time of transition and, partly perhaps, also as long as admission to the High School, as ordinary student, is still possible on easier conditions than the above mentioned normal ones, admission to the diploma examinations will also be allowed on such easier terms.

2a) For the preliminary examination: evidence of a two years' course at a German Technical High School.

2b) For the examination in one special subject: evidence of having passed, in a German Technical High School, the preliminary examination in the subject in which the principal examination is to be taken, altogether at least a three years' course at a Technical High School (for mechanical and electrical engineers also a year's workshop practice).

Semesters passed at a University, at a Mining Academy, or at another professional High School may count for the time preparatory to the two examinations.

f) The preliminary examination extends to those branches of science that prepare for, and lead to, the special subject.

The principal examination consists of the written treatment of a subject for the diploma, chosen by the board of examiners, or, instead of this (sometimes along with it), or several such questions of smaller extent, to be treated under supervision; next of an oral part, dealing with the chief branches of the special subject.

Besides, for both examinations, the results of the practical exercises performed during the course are to be presented, and taken into account, in forming a judgment are the examination.

Lately, these regulations have also, in most of the Federal States, been applied, in the case of the first (theoretical) State examination for the technical Civil Service. This first examination is everywhere followed by a second, practical, State examination, after a preparatory practical course, as a rule, of three years.

For the students of agriculture in Munich, a similar examination takes place, by which the diploma for that subject may be obtained.

In addition to the technical State examinations, others are also indirectly connected with some single Technical High School, such as the State examinations for teachers in the various divisions of physical and technical instruction, and also the pharmaceutical exa-

minations, as well as those instituted by the Imperial government for alimentary analysts.

#### *Graduation.*

When the Technical High Schools received the right of bestowing the title of Certificated Engineer, they obtained at the same time that of granting the degree of Doctor, in Prussia, Saxony, Württemberg, Baden, Hesse, and Brunswick, under the name of „Doctor of Engineering“ („Doctoringenieur“), in Bavaria under that of „Doctor of Technical Science“.

The conditions on which this degree is bestowed, with reference to the producing of a scientific dissertation, are the same as at the Universities. But in addition, and without exception, the candidate must previously have passed the diploma examination, or an equivalent State examination. The necessity of possessing the diploma implies also a previous academical course of study of at least three years.

When the dissertation has been reported on and accepted, it is followed by an oral examination, which, starting from the subject dealt with in the dissertation, has to cover the candidate's special subject.

All the technical departments in the whole of the High Schools have the right of granting degrees, in Bavaria also the agricultural and the general department, namely, in the subjects represented by them, in so far as these belong to the technical sciences, or when they appear as their foundation or as accessory to them. The graduates of the technical departments of the Munich High School, when receiving the doctor's degree, are also entitled to that of „Doctor of Engineering“.

All the High Schools have besides the right of bestowing, *honoris causa*, and as a rare distinction, the degree of Doctor of Engineering (or also of Doctor of Technical Science) on men prominent in the technical sciences.

Such persons must be proposed by the unanimous vote of a department, and approved of by a unanimous resolution of the Senate of the High School.

#### *Other Examinations.*

In addition to the examinations already mentioned, half-yearly ones take place in all the Technical High Schools, in the separate subjects of instruction. Only those students are entitled to take part

in them, who have been enrolled for the subject in question. At their own desire the students receive a testimonial as to the results of these examinations, which can also be registered in the final certificates. These examinations are obligatory for candidates for bur-saries, and for those students who apply for remission of college fees.

In Darmstadt and Karlsruhe, in addition to the diploma examination, special ones in particular branches („Fachprüfungen“) take place, in Darmstadt intended exclusively for foreigners, in Karlsruhe generally for those students who desire to give evidence of knowledge in a special branch of study. The examination extends over a group of at least three subjects, and for admission to it no leaving-certificate is required.

#### *Prize-Essays.*

So as to encourage scientific and artistic pursuits among the students, most of the Technical High Schools, once a year, propose subjects for prize-essays, in the various departments. The award to the successful competitor consists in a sum of money.

### 4. Total Attendance.

The following Table shows the total attendance for all the German Technical High Schools and for the one in Zürich. The figures are those of the winter semester.

Table of Attendance.

Winter Semester	Aachen	Berlin	Brunswick	Darmstadt	Dresden	Hanover	Karlsruhe	Munich	Stuttgart	Total for the German High Schools	Zürich

Besides allowance for salaries 1903: 10 500 M.; 1890: 7 300 M.; 1878: 3600 M.

Since the Winter Semester of 1898/99 a Commercial Department has been connected with the Technical High School, which in 1903 received the designation of „Commercial High School in connection with the Royal Technical High School.“ Its Statistics are the following:

Number of Teachers.

Semester	Professors and other Teachers in the Techn. High School	Teachers in the Commercial High School	
		Chief Department	Subsidiary Department
S. 1903	16	3	4
W. 1898	14	2	4

Number of Students.

Semester	Regular Students	Temporary Hearers	Total
S. 1903	11	3	14
W. 1898	9	12	21

Total of Receipts.

Financial Year	From private Property, Allowances from Corporations M.	From private Earnings M.	Total M.
1903	21 050	1 759	22 809
1898	22 500 <sup>1)</sup>	2 077	24 577

<sup>1)</sup> Including 15 000 M. in one sum from the Aachen and Munich Fire Insurance Company.

Total of Expenditure.

Financial Year	Salaries and Remuneration of Professors and other Teachers M.	For Institutes and Collections M.	Administrative and other Expenses M.	Total
1903	19 649	1 400	1 760	22 809
1898	7 596 <sup>1)</sup>	460 <sup>1)</sup>	420 <sup>1)</sup>	8 476 <sup>1)</sup>

<sup>1)</sup> These sums represent the requirements of only half a financial year. To them must be added 5804 M. as extraordinary expenditure for original establishment.

**4. Technical High School of Munich (Bavaria).** (Founded 1868).

Extraordinary expenditure, especially that on building alterations, is not included in the above Summary.

## VII. HIGH SCHOOLS FOR SPECIAL SUBJECTS.

---

As the Universities in their faculties, the Technical High Schools comprise in their departments several branches of study. But along with these, there are also institutions that are destined exclusively for the scientific teaching of separate technical subjects. Some of these subjects, such as mining engineering, forestry, the science of agriculture, are also represented in certain Technical High Schools, while agriculture is taught in several, forestry in a few, of the Universities. The special subject of veterinary science, on the other hand, is in the great majority of cases assigned to the Veterinary High Schools, while only in the University of Giessen there exists a special department for this subject in the medical faculty. An entirely new kind of institutions has sprung up in the shape of Mercantile High Schools. Three of these are independent establishments, only one, that in Aachen, exists as a department of the Technical High School there.

These special institutions show their character as High Schools by imparting the highest scientific education in their subjects, and by demanding of their students the same previous schooling as the Universities. Into most of them only such scholars are admitted as possess the leaving-certificate of a secondary school with nine classes, the others receive also those who have passed through only six classes, but in that case they demand evidence of a previous practical preparation.

In the following remarks a few particulars are given as to the special High Schools at present existing in the German Empire.

---

## 1. Mining Academies.

Among the German Federal States, only Prussia, and in the second place, Saxony possess a mining industry of prominent economical importance. The Prussian State itself has extensive mining grounds, as is evident from the mere fact that the gross receipts from governmental mining, foundry, and salt-pit operations were estimated in the budget of 1902 at 190.6 millions of Marks, and the net receipts at 30.8 millions.

For the management of these works, and for filling up the technical posts under the authorities entrusted with the supervision of the Mining Department in general, a considerable number of higher officials are required, who must possess a corresponding technical and generally scientific previous knowledge. According to the regulations of September the 22nd 1893, for entrance into the Mining Department of the Civil Service, the production of a leaving-certificate of a Gymnasium, of a Realgymnasium, of a Prussian Higher Realschule, or of a school ranking with the latter, is required. At first the aspirants have to pass, as „mining candidates“ („Bergbaubeflissene“), through a one year's practical course of work, which is followed by a three years' academical course of study. The latter comprises at least one year of attendance at a University, while two years can be passed at the Mining Academies in Berlin and Clausthal, or in the Mining Department of the Technical High School in Aachen. Attendance at the other Technical High Schools, and at the Saxon Mining Academy in Freiberg, will be counted up to only one year. After passing his first examination, the candidate is appointed Mining „Referendar“, and after an additional three years' preparation and another examination, Mining „Assessor“. Many mining experts who wish to enter the service of private persons, nevertheless begin their career as civil servants, and pass the first examination or both. But they can also offer themselves for a special examination in the Mining Academies, and on passing obtain a certificate.

1. The Royal Mining Academy in Berlin, founded 1770, reorganised 1860. It is connected with the Prussian Geological State Institution, and is under the authority of the Ministry of Commerce and Industry. The curriculum comprises principally higher mathematics, geodesy, mine-surveying, descriptive geometry, drawing and construction, mechanics, mechanical engineering, anorganic chemistry chemical technology, mineralogy, petrography, general and special

geology, paleontology, science of mining, knowledge of salt-mining, practical metallurgy, assaying of metals, iron-mining, assaying of iron, the laying out of iron-works, gas analysis, electro-technology, mining law, civil law.

The first director of the Geological State Institution is at the same time director of the Mining Academy. He is seconded by another, a scientific, director. The teaching staff consists of 10 salaried professors, 5 commissioned officials of the Geological Institution (including the second director), 9 extraordinary professors and privat-docents (Summer 1903).

1895/6	177, „ „	93	„ „ „	18	„
1896/7	180, „ „	82	„ „ „	13	„
1897/8	183, „ „	85	„ „ „	13	„
1898/9	234, „ „	110	„ „ „	10	„
1899/00	246, „ „	97	„ „ „	15	„
1900/1	293, „ „	91	„ „ „	21	„
1901/2	342, „ „	106	„ „ „	32	„

#### Receipts and Expenditure, according to the Financial Year 1903.

For the Royal Geological State Institution and the Mining Academy:

Receipts . . . . . 135 800 M.

Of which 24 800 M. as fees for lecture and practical work, and 20 000 M. for analytic experiments.

Expenditure . . . . . 769 310 M.

Of which for:

Salaries . . . . . 252 550 M.

Allowance for House-rent . . . . . 47 280 „

Teachers' share in Fees . . . . . 6 200 „

Assistants, Institutes, etc. . . . . 119 850 „

\*) Mining Candidates („Bergbaubeflissene“) are those that intend to enter the government service.

Daily pay, Expenses for Travelling and	
Removal . . . . .	138 000 M.
Grants to Students . . . . .	1 600 „
Upkeep of Collections, etc. . . . .	13 330 „
Upkeep of official Buildings . . . . .	14 000 „
Geological Maps, Treatises, etc. . . . .	76 500 „
Building Alterations and Acquirement	
of Ground Property . . . . .	118 000 „

2. The Royal Mining Academy in Clausthal (Prussia). As early as the 16th century, the Lyceum in Clausthal, in accordance with the needs of the extensive mining industry in the Harz, was provided with suitable technical instruction for miners and founders, and in 1775 branched off as a separate course. In the year 1811, a Mining school was established, the upper division of which received in 1864 the name of Mining Academy. After the union of the kingdom of Hanover with Prussia, the Mining Academy in Clausthal was organised on the principles of that in Berlin.

Number of Teachers: 8 salaried professors, 5 teachers in the collateral division, 6 assistants.

Number of Students:

1893/4 . . .	148, of whom 35 foreigners
1902/3 . . .	232, „ „ 32 „

Private Receipts of the Institution:

1903/4 from lecture fees . . .	25 550 M.
from other sources . . .	43 280 „

Total . . . 68 830 M.

Ordinary Expenditure 1903/4: 128 340 M

Extraordinary Expenditure: 1901/2—1903/4 (new buildings) 555 000 M.

3. The Royal Mining Academy in Freiberg (Saxony), founded 1766, attained in the 18th century, especially through the geologist A. G. Werner, to great importance. The institution is attended both by candidates for the higher governmental mining posts in Saxony, and by those who desire to be employed in private undertakings, as managers or as mining or foundry engineers. For admission as student the leaving-certificate of a school with nine classes is required. The subjects of instruction are substantially the same as those in the Prussian Mining Academies.

Number of Teachers: 12 ordinary professors, 3 extraordinary professors, 3 other teachers, 3 assistants.

Number of Students:

1893/4 . . . 168, of whom 65 foreigners  
 1902/3 . . . 471, „ „ 275 „

Private Receipts:

1902 . . . . . 58 318 M.

Expenditure:

1902 . . . . . 131 728 M.  
 therefore State Allowance . . 73 410 „

In the year 1869 the three Mining Academies together had about 144 students; in 1880 their number had risen to 394, in 1899 to 763.

## 2. Forestry Academies.

The German Empire has an extent of forest ground covering 14 million Hectares (about 34½ million acres), of which 4 717 000 Hect. are government, and 2 258 000 Hect. communal, forests. For the intelligent management of these forests, a considerable number of higher officials is required, who receive their training, partly at the Universities, partly in special Forestry Academies. The condition of admission into the latter is, in Prussia, the possession of a leaving-certificate of a Gymnasium, of a Realgymnasium, or of a Higher Realschule. In Bavaria and Saxony, on the other hand, the certificates of only the two former kinds of schools are recognised.

1. The Royal Forestry Academy in Eberswalde (Prussia), founded 1830, to replace the Forestry Academy reorganised 1821 in Berlin in connection with the University. According to the Prussian regulations, the candidates for the higher Forestry service must first pass through a one year's practical preparation, then attend a Forestry Academy for at least two years, next pass a first examination, and then, as Forestry „Referendar“, follow for one year courses in law and political economy at a German University. After two more years of further practical preparation, the Forestry „Referendar“ can present himself for a second examination, and when successful, he has the title of Forestry „Assessor“, and can receive an appointment.

The curriculum of the Forestry Academy embraces the following subjects: anorganic and organic chemistry, knowledge of soils, mineralogy and geology, meteorology and climatology, botany, zoology, piscatology, law, geodesy, arboriculture, forest preservation, utilisation of forest products, forest management, forestry profit and loss, history of forestry, forest administration and statistics, State management of forests, forest-road construction, art of hunting.

The teaching staff of Eberswalde consists of 13 professors and 4 forestry „assessors“ as assistants.

The number of students in the summer of 1903 amounted to 62, including 31 foreigners (26 Russians).

The private receipts of the institution, according to the estimates, amount to 12 300 M., the expenditure to 125 470 M., the State allowance, therefore, to 113 170 M. With the Academy is connected a chief station for forestry experiments.

2. The Royal Forestry Academy in Münden (Prussia) was opened in 1868. Organisation and curriculum are the same as in the Academy at Eberswalde. The teaching staff consists of four professors of forestry (including the director) with one assistant, five professors of natural science and mathematics, and three representatives of other subjects.

The number of students, in the winter of 1903/4, amounted to 66, including 7 foreigners. To both academies only a limited number of such students are admitted as expect to be employed in the Forestry department of the Prussian Civil Service. Private receipts (1902) 6985 M., expenditure 90 630 M.

3. The Royal Forestry Academy in Tharandt (Saxony) originated in a private school of forestry founded in 1811, and was raised in 1816 to the rank of a State institution. The aspirants for the higher posts in the Forestry department of the Saxon Civil Service must, after a practical preparatory course of at least half a year, attend a University for one year, and then pass through a course of five semesters in the Forestry Academy. The curriculum is similar to that in Prussia. Teaching staff, 7 ordinary professors, 2 extraordinary professors, 2 other teachers, 3 assistants. Number of students in the years 1894—1902 on an average 81. Private receipts 14 500 M., expenditure 92 250 M., State allowance, therefore, 77 750 M.

4. The Royal High School of Forestry in Aschaffenburg (Bavaria). Original foundation 1807, raised to the rank of a govern-

ment institution in 1819. According to the regulations existing at present, the aspirants for the Forestry department of the Bavarian Civil Service, having obtained the leaving-certificate of a Gymnasium or of a Realgymnasium, must study for two years at the High School of Aschaffenburg, and another two years in the faculty of political economy in the University of Munich. Teaching staff, 6 professors, 2 other teachers. Number of students, on an average 60 (only 20 aspirants for the Civil Service are received yearly). Yearly expenditure 47 000 M.

5. The Forestry Institution in Eisenach (Saxe-Weimar); founded in 1830 as a private establishment, government institution since 1850. Teaching staff, one director, 3 chief masters, 3 other teachers. Number of students, 45.

### 3. Agricultural High Schools.

The Agricultural High Schools serve the purpose chiefly of affording a scientific training for the heads of large agricultural undertakings, whether owners, tenants, or managers. In several of the Universities (Breslau, Göttingen, Halle, Königsberg, Leipzig, Jena, Giessen) there are Agricultural Institutes, the aims of which are the same or those of the special High Schools. In the Technical High School of Munich there is a special department for Agriculture. For admission to the Agricultural High Schools the qualification for a one year's military service is required, that is to say, the passing through six classes of a secondary school, and through a two years' practical course. The curriculum extends, as a rule, over two years, at the end of which the students can obtain their diplomas by passing an examination. The course of instruction embraces, partly general scientific subjects, such as physics, chemistry, botany, zoology, mineralogy and geology, political economy, partly specially agricultural subjects, such as knowledge of management and valuation, of animal and vegetable products, of machines and implements, agricultural technology, knowledge of manures and feeding stuffs, etc. Special courses are held for the training of land-surveyors and of practical irrigators and drainers. Also the teachers in the higher agricultural schools can pass through their studies in these High Schools.

1. The Agricultural High School in Berlin, founded 1870, contains a department for agriculture, one for geodesy, one for irrigation and draining and one for agricultural-technical processes (distilling, brewing, sugar manufacturing, etc.).

Teaching staff: 18 Professors, 24 Assistant Masters and Privat-docents.

Students in S. S. 1903: . . . 461 Germans, 49 foreigners.

W. S. 1903/4: . . . 614 „ 97 „

Private Receipts in financial year 1902: . . . 107 464 M.

Total Expenditure „ „ „ 1902: . . . 397 178 „

2. The Agricultural Academy Bonn-Poppelsdorf (Prussia), founded 1847.

Teaching staff: 11 Professors, 13 Assistant Masters.

Students: average for S. S. 1903 and W. S. 1903/4 353 Germans, 18 foreigners.

The students are at the same time matriculated at the University. The majority of them are land-surveyors and practical irrigators and drainers.

Private Receipts in financial year 1902/3: . . . 69 527 M.

Total Expenditure „ „ „ „ . . . 279 477 „

Besides the estate managed by the institution

earns . . . . . 46 485 „

and spends . . . . . 50 966 „

3. Württemberg Agricultural Academy Hohenheim (Württemberg), founded 1818.

Number of Teachers: 20, incl. 9 ord. Professors.

Number of Students: S. S. 1903 and W. S. 1903/4 62 Germans, 32 foreigners.

Private Receipts: 1903/4 . . . . . 75 470 M.

Total Expenditure: „ . . . . . 256 877 „

4. Academy of Agriculture and Brewing in Weihestephan (Bavaria), founded as Agricultural Central School at Schleissheim in 1804, removed to Weihestephan in 1852. It contains a department of agriculture and of practical brewing, besides a horticultural and dairy school.

Number of Teachers: 16 Professors and 7 other Teachers.

„ „ Students: W. S. 1903/4 152.

Private Receipts 1902 and 1903, yearly: . . . 65 679 M.

Total Expenditure: . . . . . 166 676 „

#### 4. Veterinary High Schools.

The functions of the scientifically trained veterinary surgeons have acquired a considerable extension in more recent times, as these practitioners not only treat the diseases of domestic animals, but also co-operate in carrying out important protective measures, especially in the prevention of epidemics among animals, and in the hygienic inspection of cattle and meat for the market. Hence the requirements as to the preparatory training of the veterinary surgeons have been continually raised. According to the latest regulations, applying to the whole Empire, those who wish to acquire the qualification of veterinary surgeon (and at the same time the right of calling themselves so), must be in possession of a leaving-certificate from a secondary school with nine classes (Gymnasium, Realgymnasium, or Higher Realschule), and have studied, for at least seven semesters, at a Veterinary High School. The preparatory lectures on natural science and general medicine can also be heard in Universities. In the University of Giessen, the medical faculty has a special veterinary division, which has the character of a Veterinary High School. In those Universities that possess agricultural institutes, a more popular instruction in veterinary science is given to students of agriculture, but is insufficient for professional veterinary surgeons.

1. The Veterinary High School in Berlin, founded 1790, High School 1887. Closely connected with it is the military Veterinary Academy.

Number of Teachers: 10 Professors, 16 Assistant Teachers.

„ „ Students, end of 1902: 470 civil students (incl. 63 foreigners), and 145 military students.

Private Receipts, financial year 1903/4: . . . 158 686 M.

Total Expenditure, „ „ „ . . . 366 300 „

2. The Veterinary High School in Hanover (Prussia), founded 1778, High School 1887.

Number of Teachers: 9 Professors, 17 Assistant Teachers and other Assistants.

Number of Students, S. S. 1903: 296 Germans, 12 foreigners.

Private Receipts, financial year 1902/03: . . . 90 817 M.

Total Expenditure „ „ „ . . . 203 494 „

3. The Veterinary High School in Munich (Bavaria), founded 1790, High School 1890.

Number of Teachers: 8 ordinary, 2 extraordinary, Professors, 6 other Teachers, 14 Assistants, and 2 Farriers.

Number of Students, S. S. 1902: 352, incl. 300 Bavarians, 48 other Germans, 4 foreigners. W. S. 1902/3: 350, incl. 274 Bavarians, 72 other Germans, 4 foreigners.

Private Receipts, 1902: . . . . . 28 666 M.

Total Expenditure, „ . . . . . 228 563 „

4. The Veterinary High School in Dresden (Saxony), founded 1780, High School 1889.

Number of Teachers: 15 Professors, 15 Assistants.

„ „ Students, W. S. 1902/3: 226, incl. 31 foreigners.

S. S. 1903: 216, „ 23 „

Private Receipts, 1902/3: . . . . . 33 800 M.

Total Expenditure, „ . . . . . 169 650 „

5. The Veterinary High School in Stuttgart (Württemberg), founded 1821, High School 1890.

Number of Teachers: 6 ordinary, 5 extraordinary, Professors.

„ „ Students, S. S. 1903: 114 Germans, 4 foreigners.

W. S. 1903/4: 113 „ 8 „

Total Expenditure 150 000 M.

## 5. Commercial High Schools.

Higher Commercial Schools or Academies have existed for a long time in several larger towns, but with a decidedly practical tendency. In the Commercial High Schools, on the other hand, especially the economical sciences are to be treated, as in the Universities, from a strictly scientific point of view. At the same time they are to serve the purpose of training teachers for the higher Commercial Schools.

1. The Municipal Commercial High School in Cologne (Prussia), founded 1900, after the banker G. v. Mevissen had set apart a considerable sum for this purpose.

Number of Teachers: 10 Professors and other Teachers in the chief department, 1 Privatdocent, 3 Lecturers, besides 6 Professors from Bonn or from Heidelberg, and further, 29 other Lecturers.

Number of Matriculated Students, W. S. 1902/03: 198, incl. 17 foreigners. (Total of all under tuition 1537).

Number of Matriculated Students, S. S. 1903: 221, incl. 20 foreigners. (Total of all under tuition 917).

Private Receipts, 1903: 127 450 M. Total Expenditure, 1903 166 800 M.

2. The Academy of Social and Commercial Science in Frankfort on the Main (Prussia), founded 1901, as a municipal Institution but with a considerable private contribution.

The course of instruction is a more comprehensive one than in other similar institutions.

Number of Teachers: 11, besides 12 to 19 incidentally employed.

Number of Students, W. S. 1902/03: 546, incl. 41 foreigners (temporary and occasional hearers are included).

Number of Students, S. S. 1903: 415, incl. 31 foreigners (temporary and occasional hearers are included).

Private Receipts (incl. endowments), 157 000 M. Total Expenditure, 164 280 M.

3. The Commercial High School in Leipzig (Saxony), founded 1898 as the first institution of this kind. Teachers from the Commercial School, established in 1831, and from the University are employed.

Number of Students, S. S. 1903: 78 Germans, 80 foreigners.

Number of Students, W. S. 1903/4: 77 Germans, 91 foreigners.

Private Receipts: 45 203 M.; contributed by the State 25 000 M. by the town of Leipzig 10 000 M. Total of Expenditure: 70 203 M.

## 6. High Schools of Art.

The Royal Academy of Art in Berlin, founded 1696, re-organised 1790. Private Receipts, 1902: 48 479 M., incl. the fund of the Art Exhibition Guilds.

Total Expenditure, 1902: 136 873 M.

It embraces the following *Institutions for the Fine Arts*.

1. The Royal Academical High School for the Fine Arts in Berlin-Charlottenburg.

Number of Teachers: 27.

Number of Students, W. S. 1902/03: 254.

Number of Students, S. S. 1903: 230.

Private Receipts, 1902: 21 190 M.

Total Expenditure, 1902: 242 439 M.

2. Royal Academical Master Studios for the Fine Arts in Berlin-Charlottenburg.

Number of Teachers: 7.

Number of Students, W. S. 1902/03: 30. S. S. 1903: 27.

Private Receipts: 3180 M.

Total Expenditure: 48 720 M.

To the Royal Academy belong besides the Berlin-Charlottenburg institutions for Music mentioned below.

In Prussia exist, moreover, Academies of Art in Düsseldorf, Cassel, and Königsberg. Outside Prussia are others in Munich, Dresden, and Stuttgart. Further may also be mentioned the Grand Ducal Academy of the Fine Arts in Karlsruhe (Baden), and the Grand Ducal School of Art in Weimar.

As *Institutions for Music* are to be considered

1. The Royal Academical High School of Music in Berlin-Charlottenburg.

Teaching Staff: 41 male, 8 female, Teachers.

Attendance, W. S. 1902/03: 151 male, 126 female, Students; S. S. 1903: 142 male, 126 female, Students.

Private Receipts, 1902: 52470 M.

Total Expenditure: 248522 M.

2. The Royal Academical Master Schools of Musical Composition in Berlin-Charlottenburg.

Attendance, W. S. 1902/03: 24 Students.

S. S. 1903: 21 Students.

Private Receipts: 240 M.

Total Expenditure: 11855 M.

3. Royal Academical Institute of Church Music in Berlin-Charlottenburg.

Teaching Staff: 6 Teachers.

Attendance, S. S. 1902: 20 Students, 4 Hearers; W. S. 1902/03: 20 Students, 2 Hearers.

Private Receipts, 1902: 900 M.

Total Expenditure, 1902: 19 839 M.

Unconnected with the Berlin Royal Academy are the following institutions:

## 4. Royal Academy of Music in Munich.

Teaching Staff: 40 male and female Teachers.

Attendance, 1902/03: 317 male and female Students.

Estimates, in round numbers, 130000 M. incl. 55000 M. of State allowance.

## 5. Royal School of Music in Würzburg.

Teaching Staff: 19 (7 Professors, 12 other Teachers).

Attendance, 1902/03: 218 students (male and female) of music, 27 women admitted to chorus singing, 676 hearers.

Private Receipts: 13000 M.

Total Expenditure: 68700 M.

## 6. Royal Conservatory of Music and Acting in Dresden.

Teaching Staff: . . . 73 male and 43 female Teachers,

Attendance, 1902/3: 539 „ „ 838 „ „ Students.

## 7. Royal Conservatory of Music in Leipzig.

Teaching Staff: . . . 42 male Teachers, 1 female Teacher.

Attendance 1902: . 401 „ 447 female, Students.

Total Receipts: . . . . . 201 000 M.

Total Expenditure: . . . . . 187 700 „

## 8. Royal Conservatory of Music in Stuttgart.

Teaching Staff: 32 male and 6 female Teachers.

Attendance 1092/3: 79 male students, 110 female students as professional musicians, 328 as dilettanti.

Estimates: 92 000 M.

## 9. Grand Ducal Conservatory of Music in Karlsruhe (Baden).

Teaching Staff: 28 male and 17 female Teachers.

Attendance 1902/3: 472 Students, 117 temporary pupils, 27 children.

Estimates: 62 800 M.

## 10. Grand Ducal School of Music in Weimar.

Teaching Staff: 25 male Teachers and 1 female Teacher.

Attendance, 1902/3: 87 male, 93 female, Students.

Besides these there are various educational institutions for music supported by towns or by private societies.

## 7. High Schools of the German Army and Navy Administration.

1. The Royal Military Academy in Berlin, for the further training of officers who have served in their ranks for at least three years, and who, presumably, will not be promoted to the rank of captain in the next five years. Admission is obtained by passing an entrance examination, but the total number of those received may not exceed 400. The course extends over three years, and in addition to the military-technical sciences properly so called, embraces more particularly, military history, mathematics, and foreign languages. The Academy is attended by officers of all the Federal States, with the exception of Bavaria. The yearly expenditure amounts to 335 102 M.

2. The Royal School of Artillery and Engineering. — All the officers of the foot-artillery and of the pioneers, after having served for at least one year and nine months with the train, have to pass through a one year's course at this school. A part of the foot-artillerists are there picked out for a second upper course of one year. Under certain conditions, 30 officers of the field-artillery can take part in the lower, and 20 in the upper course. The total number of officers ordered to this school, in the year 1903/4, amounted to 135; besides 4 foreigners were admitted. The expenditure amounted to 198 658 M.

3. The Royal Military-technical Academy in Berlin-Charlottenburg was opened only in 1903. It contains a department for engineering, one for means of communication (railways, military telegraphy, aerial navigation), and one for knowledge of weapons, replaced, in the third year, by a department of ordnance construction and of the science of projectiles. About 50 officers are ordered every year to this school. According to the estimates of 1903/4, the expenditure amounted to 103 000 M.

4. The Imperial Naval Academy in Kiel (Prussia), founded 1872, serves the purpose of enabling naval officers, by extended scientific training, to qualify themselves specially for the higher ranks in the navy. The course extends to two years, the yearly expenditure for 1903/4 amounted to 183 055 M.

5. The Bavarian Military Academy and the Bavarian School of Artillery and Engineering in Munich, serve the same purposes as the corresponding Prussian institutions.

## Number of Students in the Special High Schools, 1869—1899.

Year	Mining Academies	Forestry Academies*)	Agricultural High Schools	Veterinary High Schools
1869	144	261	357	267
1872	168	317	298	271
1875	264	269	269	284
1880	262	394	353	436
1885	344	394	468	735
1888	343	386	483	962
1891	389	255	694	1 047
1896	523	330	1 070	1 140
1899	763	278	890	1 343

\*) The Forestry School of Eisenach (with 40 - 50 Students) is not included.

## VIII. MIDDLE AND LOWER PROFESSIONAL SCHOOLS.

### 1. Technical Schools.

In the Technical High Schools admission to immatriculation is regularly made conditional on the possession of the leaving-certificate of a secondary School with nine classes. In this manner they are marked off from the intermediate Technical institutions, which require only the qualification for a one year's military service, that is to say, the pupil must have passed through six classes of a secondary school. Many of these institutions accept a still smaller amount of preparatory general schooling, but all of them insist on the pupils having gone through some practical training in their trades. The lower professional schools for artisans, foremen, etc. demand only the previous teaching of the elementary school.

1. The institutions that approach most nearly to the Technical High Schools are those that contain several departments, with a course extending to more than two years. This type of school is not represented in Prussia. Among those in Saxony may specially be mentioned the government Industrial Academy at Chemnitz, with departments of mechanical and chemical technology, of architecture, and of electro-technology. The conditions of entrance are the possession of the qualification for a one year's military service, and (with the exception of the chemical-technical department) a previous one or two years' practical course. The curriculum in the electro-technical department is one of eight, in the others of seven, semesters. The fees for subjects of the kingdom of Saxony amount to 80 M., for other Germans to 150 M., for foreigners to 250 M. per semester. The number of pupils in the winter of 1902/03 was 381.

In Saxony there are also a few institutions which, according to their syllabus, likewise afford training for independent engineers, but in shorter courses of five or six semesters. Such are the

municipal „Technikum“ (technical school) in Limbach, with departments of mechanical engineering, electro-technology, and architecture, and with 140 pupils; the „Technikum“ in Mittweida, with 1840 pupils in 1902/03; that of Hainichen, with 230 pupils in 1902/03; the School of Engineering in Zwickau, with 209 scholars; the three last mentioned are private institutions, and with them are also connected professional courses of a less advanced kind.

Similar municipal or private institutions, which call themselves „Technikum“, many with only a two years' course, are found also in several other Federal States, to the number of thirteen altogether. To these must be added the government „Technikum“ in Bremen, consisting of a higher school of mechanical engineering, of one of shipbuilding, of a School of marine mechanical engineering, and of a building-trade school; that is to say a combination of higher and lower courses. Next, the government „Technikum“ in Hamburg, containing a higher school of mechanical engineering, one of marine mechanical engineering, one of shipbuilding, and one of electro-technology.

Further are to be mentioned among the establishments with several departments, the municipal higher Technical Institute in Cöthen, for mechanical engineering, electro-technology, and technical chemistry; and the government Technical School in Strassburg, with a higher school of technical engineering and a building-trade school. Private institutions of this kind are also found in Baden, at Mannheim, with a subsidy from the town, and in Hesse, at Friedberg.

In Bavaria the „Industrial Schools“ in Munich, Nürnberg, Augsburg, and Kaiserslautern, form a special type of higher technical educational institutions. They form a continuation to the Realschulen with six classes, and during the first two years of the course, they impart instruction in which the general subjects predominate, after the manner of the Prussian Higher Realschulen, whereas for the technical subjects properly so called, they afford only a preparation. At the close of the second year a final examination is held, by passing which the pupil is entitled to enter the Technical High School. Those who do not proceed to the High School can take the third year's course, with its mechanical-technical, chemical-technical, architectural, and, in Munich also, its commercial department. The schools are government institutions. The number of pupils in 1902/03 was 712, the total expenditure amounted to 431 000 M.

2. In Prussia the schools for the various technical branches are generally kept separate, although occasionally the schools existing in the same town are under one management. As intermediate institutions, in the sense here intended, must be considered the „higher“ Schools of Mechanical Engineering. They are devoted to the training of foremen and of technical constructors in the machine industry and other allied ones, and also to affording future proprietors and managers of such industrial establishments an opportunity of acquiring the necessary technical knowledge. For admission into the lowest class of a higher School of Mechanical Engineering a preparatory knowledge is demanded, which, besides the necessary previous practical training, is equivalent to that required for the one year’s military service.

The time-table for the four half-yearly classes, with the number of weekly hours for the single subjects is the following.

	Cl. IV	Cl. III	Cl. II	Cl. I
Business knowledge . . . . .	—	—	—	2

The fees amount yearly to 150 M. (in Cologne to 200 M.).

In addition to the „higher“ schools of mechanical engineering, and partly connected with them, there are also ordinary Schools of Mechanical Engineering. They serve the purpose of providing the necessary professional knowledge, especially practice in drawing, for future lower-class technical officials of the machinery industry, such as foremen, machinists, and managers of smaller works, and also for the proprietors of such works. The course generally lasts two years, in Cologne only a year and a half. There are also institutions with a course of two semesters, which supply extended instruction for workers in the machinery industry.

The Schools for the Metallurgy, with a course of four semesters, in Duisburg (formerly in Bochum) and Gleiwitz, are joined to schools of mechanical engineering, and provide training for the lower officials connected with the metal industry.

To the lowest class of the two kinds of schools just mentioned, and to that of the institutions with a course of two semesters, only those are admitted who can prove that they have passed through a good elementary school and through at least a four years' practice in a workshop or in the metal industry. Besides attendance at a continuation school, previous to entrance into the institution, is desirable.

Similar conditions are required for admission to the Evening Schools and Sunday Schools for engine builders, locksmiths, blacksmiths, and workers in the metal industry.

In the higher and lower schools of mechanical engineering final examinations are held by a committee of examination, formed in each institution under the presidency of a government commissioner.

Special professional schools for the brass, iron and steel hardware industry are found in Iserlohn, Remscheid, Siegen and Schmallalden. In addition to the theoretical, they also impart practical, instruction in workshops for their pupils. The yearly fees in these professional schools amount to 60 M.; non-Prussian Germans pay 160 M., foreigners 300 M. The table on page 170 gives further particulars as to these schools and those of mechanical engineering.

Outside Prussia, and in addition to the above mentioned institutions with lower divisions, there are four schools of mechanical engineering in Bavaria (among them a higher one in Würzburg), one in Saxony (in Chemnitz, under the Industrial Academy), and one each in Oldenburg and Brunswick.

3. Building-trade Schools. The object of these schools is 1. the training of masons, carpenters, and other artisans connected

<sup>1)</sup> The towns supply and keep up the School buildings, together with the necessary furnishing. — <sup>2)</sup> Barmen and Elberfeld bear all expenses jointly.

with building, by giving them an opportunity of acquiring the theoretical knowledge and the skill necessary for successfully and independently carrying on their trade; 2. the educating of assistants in the office and in practical building (draughtsmen, overseers, superintendents of offices and building operations); 3. the preparation for intermediate technical official work (such as that of clerk to a board of works, technical government and railway secretaries, etc.).

According to the regulations in Prussia, admission to the School is obtained by the pupil showing that he has received a good elementary education, that he has completed his sixteenth year, and that he has been practically employed, for at least two summers, in building and in workshops. For those who are as yet insufficiently prepared there are introductory classes. Several Building-trade Schools, in addition to the department of architecture, have another for the construction of underground works, roads, waterworks, bridges, railways, etc.

Pupils must attend the school for four half-years, which need not be taken in immediate succession, but may be interrupted by practical work in summer. This explains the great difference between the summer and the winter attendance in the single schools.

In the two lower half-yearly classes the pupils in the two departments are taught together, in the two higher classes the instruction is separate. At the conclusion of the course a final examination takes place. Further particulars as to these schools are supplied in the table on page 172.

In Bavaria there are 8 Building-trade Schools, in Saxony 5 supported by the government, and 7 by towns or other bodies, in Württemberg there is one, in the other States there are, partly in connection with other schools, 17 public and 7 private institutions of this kind.

4. For pottery and tile making there are in Prussia 3, in Bavaria 2, in the other Federal States 2 professional schools, besides one such for glass instruments.

By „Handwerkerschulen“ (Artisan or Trade Schools) are meant those schools in which, for various handicrafts, full day teaching is given, although the course may be one of only a year or half a year. Such schools are often called „Gewerbeschulen“ („industrial schools“) or „Kunstgewerbeschulen“ („industrial schools of art“), and as drawing is the chief subject of instruction in these, they can frequently not be easily distinguished from the higher Industrial Schools of Art.

In the majority of the schools the teaching is conducted in divisions, into which the pupils can be placed according to their preparatory schooling or abilities. Thus these schools can, to the fullest extent, be adapted to local requirements.

Besides, to some of these schools have been joined special departments with a definite curriculum and for definite purposes, as well as with special conditions of admissions, e. g. in Hanover a special school for copper-smiths, in Essen one for polishers. In Berlin the artisan school embraces courses for mechanics (1 year), for electro-technologists (1 year), for joiners (1 year), for painters (4 winter months), for modellers (6 winter months), for braziers, for ornamental metal-workers and similar craftsmen (6 winter months).

Further information concerning the schools in Prussia, mentioned in the preceding section, is given in the table on page 173.

In the other States the number of Artisan Schools and Industrial Schools of Art amounts to 36.

5. The professional schools for the Textile Industry are very numerous. In general they are arranged in such a manner that they may adapt themselves to the particular industry that is carried on in the locality of the school. Moreover a distinction is made between those schools that mostly serve for the training of foremen, and others in which manufacturers and higher-class employees are educated; the former are called in Prussia, „Professional Schools for the Textile Industry“, the latter „Higher Professional Schools for the Textile Industry“. Besides there are also weaving schools (Webelehranstalten) and educational weaving workshops (Webereilehrwerkstätten).

Statistics of the Prussian Schools for the Textile Industry are given in the table on page 175.

As higher Industrial Schools of Art may also be considered: 1. the Royal School of Art in Berlin. It contains a department of industrial art and the decorative arts, with day teaching for fully employed pupils, and with evening classes; and a seminary division for male and female teachers of drawing; 2. the educational institution of the Royal Museum of Industrial Art in Berlin, also with day and evening classes. The art school serves as a preparation for the latter establishment; 3. the Royal School of Art and Industrial Art in Breslau.

1) Of which the Province gives 1200 M.

In Bavaria there are 3 schools of this kind, in Saxony (including those for network and braidwork) 56, in Württemberg (including 2 weaving schools and one school for embroidery) 7, in the other States altogether 5.

6. In the next place there are numerous professional schools for special industries and crafts, part of them provided with workshops. For example, schools for woodworking (about 30), for basket-making and straw-plaiting, for lock-work, for watch-making, for printing, for carving in ivory, for toy-making, photography, violin-making, for the miller's trade, for distilling, tanning, etc. Here may also be mentioned the farriers' schools, of which there are more than 60, as in all the Federal States examinations are prescribed for those who wish to become farriers on their own account.

7. Closely connected with the large industries are the Mining-schools, which are intended for the training of intermediate technical mining officials. In Prussia there are 10 such schools with a two years' course in the lower classes, and a one years' course in the highest class. The practical work is continued, as a rule, during the courses, by the pupils. At the end of the school course examinations take place. The teaching is usually gratis, and if occasion requires, the pupils receive assistance from the mining-school funds. As introductory to these schools, there are in Prussia 43 preparatory mining-schools, in which also the lower kind of mining officials can be trained.

8. The Schools of Navigation afford sailors an opportunity of acquiring the theoretical knowledge requisite for mates and master mariners of ocean going vessels, and of preparing for the corresponding examinations. The curriculum in the division for mates lasts 8 to 10, in that for master mariners 5 to 6, months.

For admission to the classes for mates, an examination has to be passed at which a knowledge has to be shown of the subjects of the primary school, also an elementary knowledge of mathematics and of mathematical geography, besides a knowledge of political and nautical geography, in so far as it is required of a ship's officer.

Into the classes for master mariner only those are received as candidates for this qualification, who have either been admitted as mates in Germany, or who have passed the mate's examination; as candidates for the qualification of mate, only those who have already passed, entirely or for the greater part, through a course for mates in

a German public school of navigation. Exceptions may be allowed by the Minister of Commerce.

The instruction embraces, a) in the class for mates: 1. mathematics (arithmetic, plane geometry, stereometry, plane and spherical trigonometry), 2. nautical science, 3. seamanship, 4. drawing of charts and astronomical maps, 5. English language, and 6. nautical hygiene; b) in the class for master mariners: 1. revision of the subjects under a) 1, 2, and 3, to the extent required for captains of ocean going ships, 2. knowledge of costs of freights and of bills of exchange, 3. the essentials of marine engines and boilers, 4. what the master mariner has an interest in knowing of maritime and mercantile law, and of the laws relating to bills of exchange, 5. knowledge of a captain's professional conduct during the whole time of a voyage, in ordinary and extraordinary circumstances, especially in the case of sea damage, 6. English language, 7. nautical hygiene.

The Preparatory Schools of Navigation form an introduction to the class for mates in the higher schools, and to the examination of skippers on short voyages.

In Prussia there are 12 schools of navigation, with which, at the same time, preparatory schools are connected, and 7 independent preparatory schools. The former had, in 1902/3, a total of 1292, the latter of 436, pupils. The State expenditure amounted in 1903, for the schools of navigation, to 199 823 M., for the preparatory schools, to 19 603 M. In the other Federal States there are 5 schools of navigation. In Prussia there are schools for ocean steamer engineers, in Flensburg, Stettin, and Geestemünde. They prepare for the examinations prescribed by Imperial law for such engineers.

For Inland navigation there are in Prussia 37, in the other Federal States 15, schools for masters.

9. Schools of Cookery and Domestic Economy are supported in large numbers by municipalities and private societies. For girls also there are in Prussia three Government Schools of Commerce and Industry, namely for such as have completed their compulsory schooling, and wish to be educated for an industrial or mercantile calling, or as technical teachers. The courses deal with machine sewing, dress-making, making of underlinen, millinery, art needlework, pattern-drawing, typewriting, stenography, domestic economy, cookery, commercial subjects, etc.

10. The industrial Extension Courses are characterised by the fact that they do not occupy the whole day, but are held for 6 to 8

weekly hours in the evening and on Sundays. By Imperial legislation the municipalities can make this instruction obligatory for all industrial apprentices and young artisans up to the age of 18, and this has been done in many localities. In some Federal States, but not in Prussia, these compulsory extension courses have been generally introduced by State legislation. The chief subjects of instruction are German, arithmetic, and drawing, the latter in so far as it may be useful in the particular industry. In the larger towns, moreover, mathematics, physics, chemistry, French, English, and other subjects are taught.

In Prussia the number of these schools amounted, in the year 1903, to 1169, with 176 738 pupils. In 997 of them, with 137 678 pupils, the attendance was compulsory.

These courses are also often attended voluntarily by adult artisans. In most recent times also special State aided extension courses for independent craftsmen, so-called „master-courses“ (Meisterkurse), have been established in Prussia.

## 2. Mercantile Education.

1. Only during the last years Commercial High Schools have been founded, namely in Leipzig, Cologne, Frankfort on the Main, and, in connection with the Technical High School, in Aachen, to which a new one is about to be added in Berlin. But already for a considerable time public higher commercial schools, sometimes also called commercial academies, existed in several of the large towns. In the stricter sense of the term only those can now be considered as „higher“ commercial schools, which either demand, for admission to them, the certificate of qualification for a one year's military service, or have themselves the right to grant such a certificate. Of these schools there are six in Prussia, in addition to some private institutions. In Bavaria belongs to these the commercial department of the „Industrial“ School in Munich. Besides, Bavaria possesses two higher commercial schools for male, and two for female, pupils, while commercial departments are connected with 22 Realschulen. In Saxony are found higher schools of this kind in Leipzig and Dresden; in Württemberg, in Stuttgart; in Baden, in Mannheim. Also several private institutions have a programme corresponding to the higher requirements.

Very numerous are the simple commercial schools, for which only a good primary education is requisite. They have been estab-

lished by municipalities, chambers of commerce, or other societies; many of them also are private institutions.

2. The commercial continuation schools correspond to the industrial ones, and are attended chiefly by commercial apprentices in their spare time. In Prussia their number amounted, in the year 1903, to 253, with 25 927 pupils. In 157 of them, with 12 923 pupils, the attendance was compulsory.

### 3. Agricultural Professional Education.

1. The intermediate agricultural education is represented in Prussia by the Agricultural Schools. They have the character of Realschulen; their three classes correspond to the lower tertia, the upper tertia, and the lower secunda. Frequently also a preparatory school with three classes is connected with them. To the subjects of a Realschule is added as a special subject rural economy, to which from four to six weekly hours are devoted, while natural science occupies a comparatively important position, from eight to ten weekly hours. This produces, on the other hand, the necessity of restricting the teaching in other subjects, namely, in German and foreign languages, history, geography, and mathematics.

Among the ordinary teachers there is at least one who has passed the State examination for teachers of agriculture in agricultural schools, and who is consequently in possession of the leaving certificate of a Gymnasium, Realgymnasium, or higher Realschule. As objects of the special teaching apparatus of agricultural institutions, besides the collections of various kinds, are to be mentioned experimental fields, fruit and vegetable gardens. Moreover excursions are made to neighbouring estates, to agricultural exhibitions, etc.

As the end of 1903, the number of agricultural schools in Prussia was 16.

2. The Farming Schools are intended for the directly practical training of agriculturists. The pupils, of the age of 15 to 20, are mostly sons of farm owners or tenants. They are established, partly by individual practical agriculturists, partly by agricultural societies, partly by endowments. All, however, are under State control, and nearly all of them receive subsidies from the State or from public corporations. They are situated in the country, in connection with a smaller or a middle-sized estate. The head of the estate, whether owner, tenant, or manager, is at the same time director of the in-

stitution. The pupils are full boarders. In return for this and for the teaching they have to pay boarding and school fees. Many of the farming schools admit pupils without, or with half, payment.

The instruction is both practical and theoretical, preferably the former in summer, the latter in winter. The practical teaching extends to all kinds of agricultural labour, which every pupil must learn to perform by continued personal application.

The theoretical teaching is given in the elementary subjects, in rural economy, in natural science, a subject of special importance to agriculture, in horticulture and fruit-growing, in veterinary science, frequently also in select sections of national economy and agricultural law. The complete course lasts two years. Admittance is conditional on previous elementary education, and knowledge of simple agricultural practice.

In Prussia there are at present 21 farming schools.

3. The Agricultural Winter Schools, like the farming schools, are intended for young farmers of the age of 15 to 20, but the teaching is a purely theoretical one. The complete course in them lasts two winters; in summer the pupils work on their fathers' or on other estates, and thus earn their own living. With respect to the subjects and to the manner of teaching, the winter schools are likewise very similar to the farming schools. The number of daily hours of teaching is naturally a larger one, as there is no practical occupation. Hence, in two winters the same amount of theoretical work can be overtaken as in two years in the farming schools.

The winter schools are found mostly in a small town. The pupils live with the citizens, with whom they are also boarded at moderate rates. The school fees for one winter are on an average 20 to 30 M.; in a few institutions they are also a little higher or a little lower.

The winter school is conducted by a director who has passed the final examination of an agricultural High School or the State examination. Frequently he is assisted by a second teacher of agriculture. In such a case the winter school is usually divided into two separate classes, one of which forms the 1st, the other the 2nd year's course.

The number of winter schools in Prussia amounted, in the year 1903, to 128.

In summer, when no teaching takes place, the directors and teachers of the winter schools are occupied as visiting lecturers.

4. In addition to these general agricultural schools, there are others for special branches of agriculture and kindred subjects. Such are the schools for meadow cultivation, horticulture and fruit-growing, dairy-farming, domestic economy, and those for bee-masters and for farriers. They are partly independent institutions, partly connected with another agricultural school. The schools for

horticulture and fruit-growing, and for domestic economy are the most numerous and are attended by the largest number of pupils.

For the training of lower-class forestry officials there are in Prussia two special schools.

Statistics on the subject of the agricultural schools in Prussia are contained in the table on page 181.

5. The agricultural continuation schools are chiefly intended for strengthening and extending the elementary education of the rural population, but in some of them also technical agricultural instruction is given. The teaching is conducted principally in winter, during some evenings of each week, and on Sunday afternoons. In Prussia there were, in the year 1902, 1421 rural continuation schools with 20 666 pupils, causing an expenditure of 182 236 M.

6. Some information on the general agricultural schools in the other Federal States is supplied in the following table.

Federal State	Number of Agricultural Schools (Schools of Agriculture, Farming Schools, Agricult. Winter Schools and similar schools) with a general agricult. Curriculum in 1902/03	Number of Pupils attending these Schools in 1902/3. (Only Pupils of agricultural subjects are included)	Number of Schools and Pupils to every 10 000 agricult. Estates of 12,5 acres and more	
			Schools	Pupils
